

Some Layout and Export Tricks in Gephi

Lynn Cherny (@arnicas)

Plugins to Add to Gephi

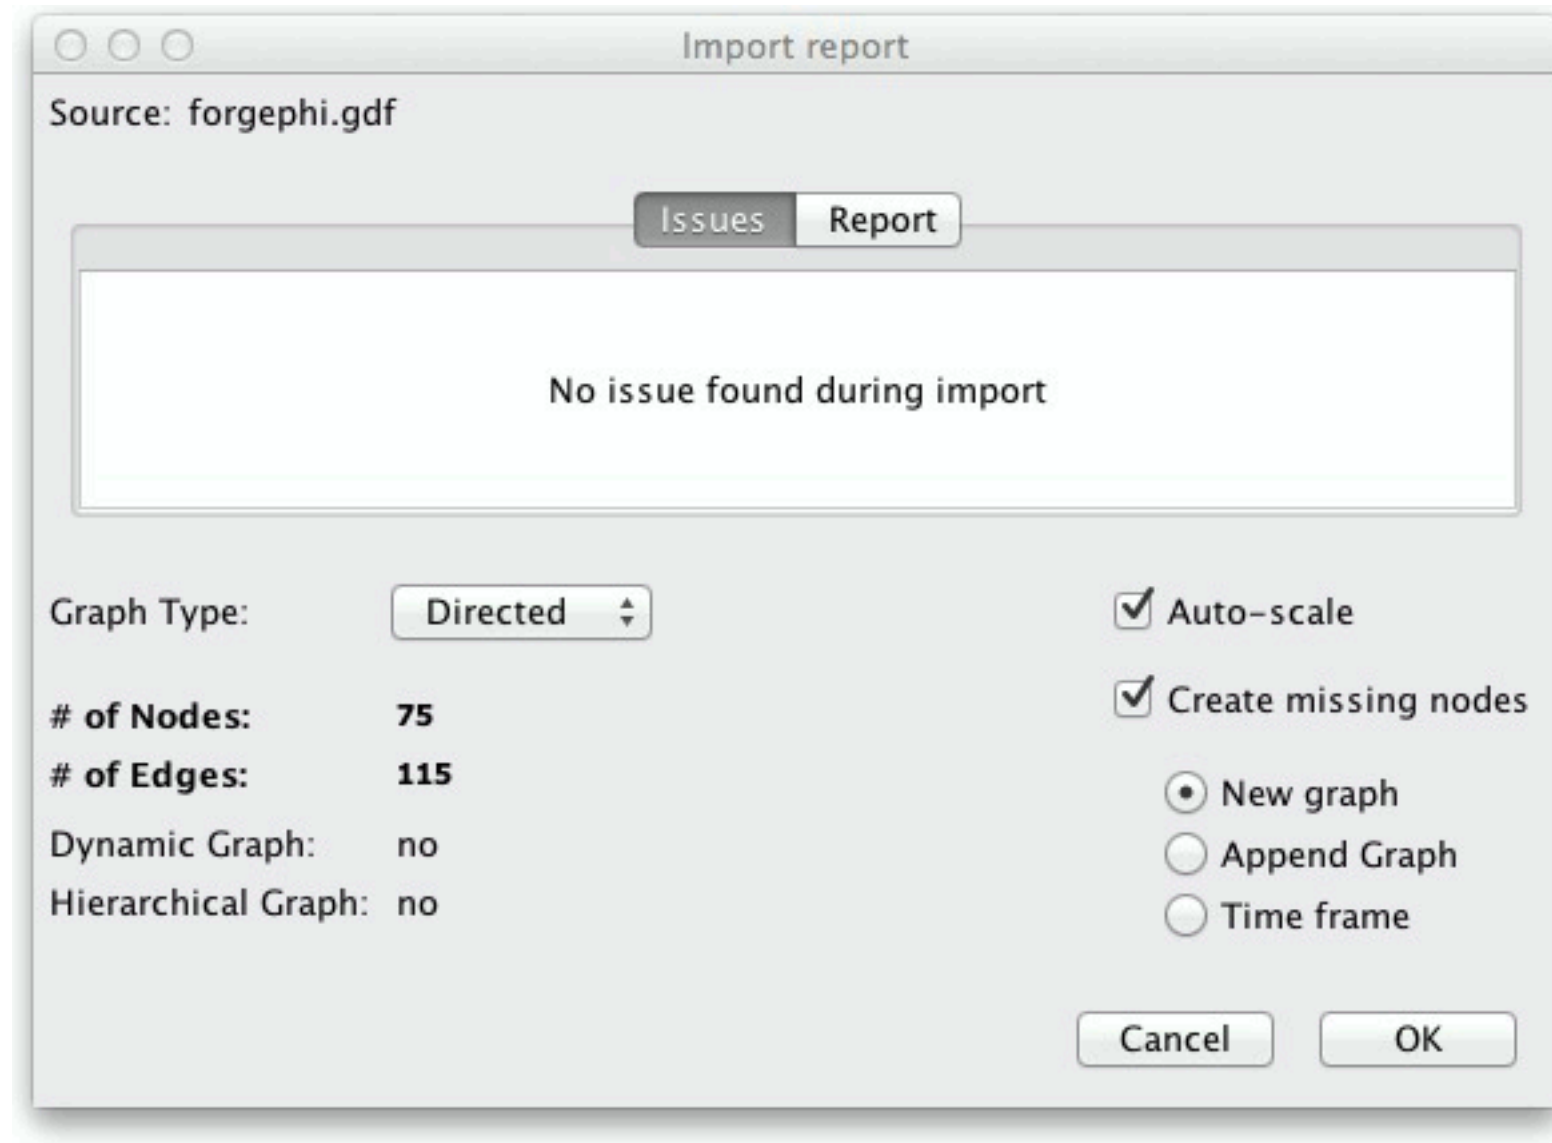

- Circular Layout
- SigmaExporter

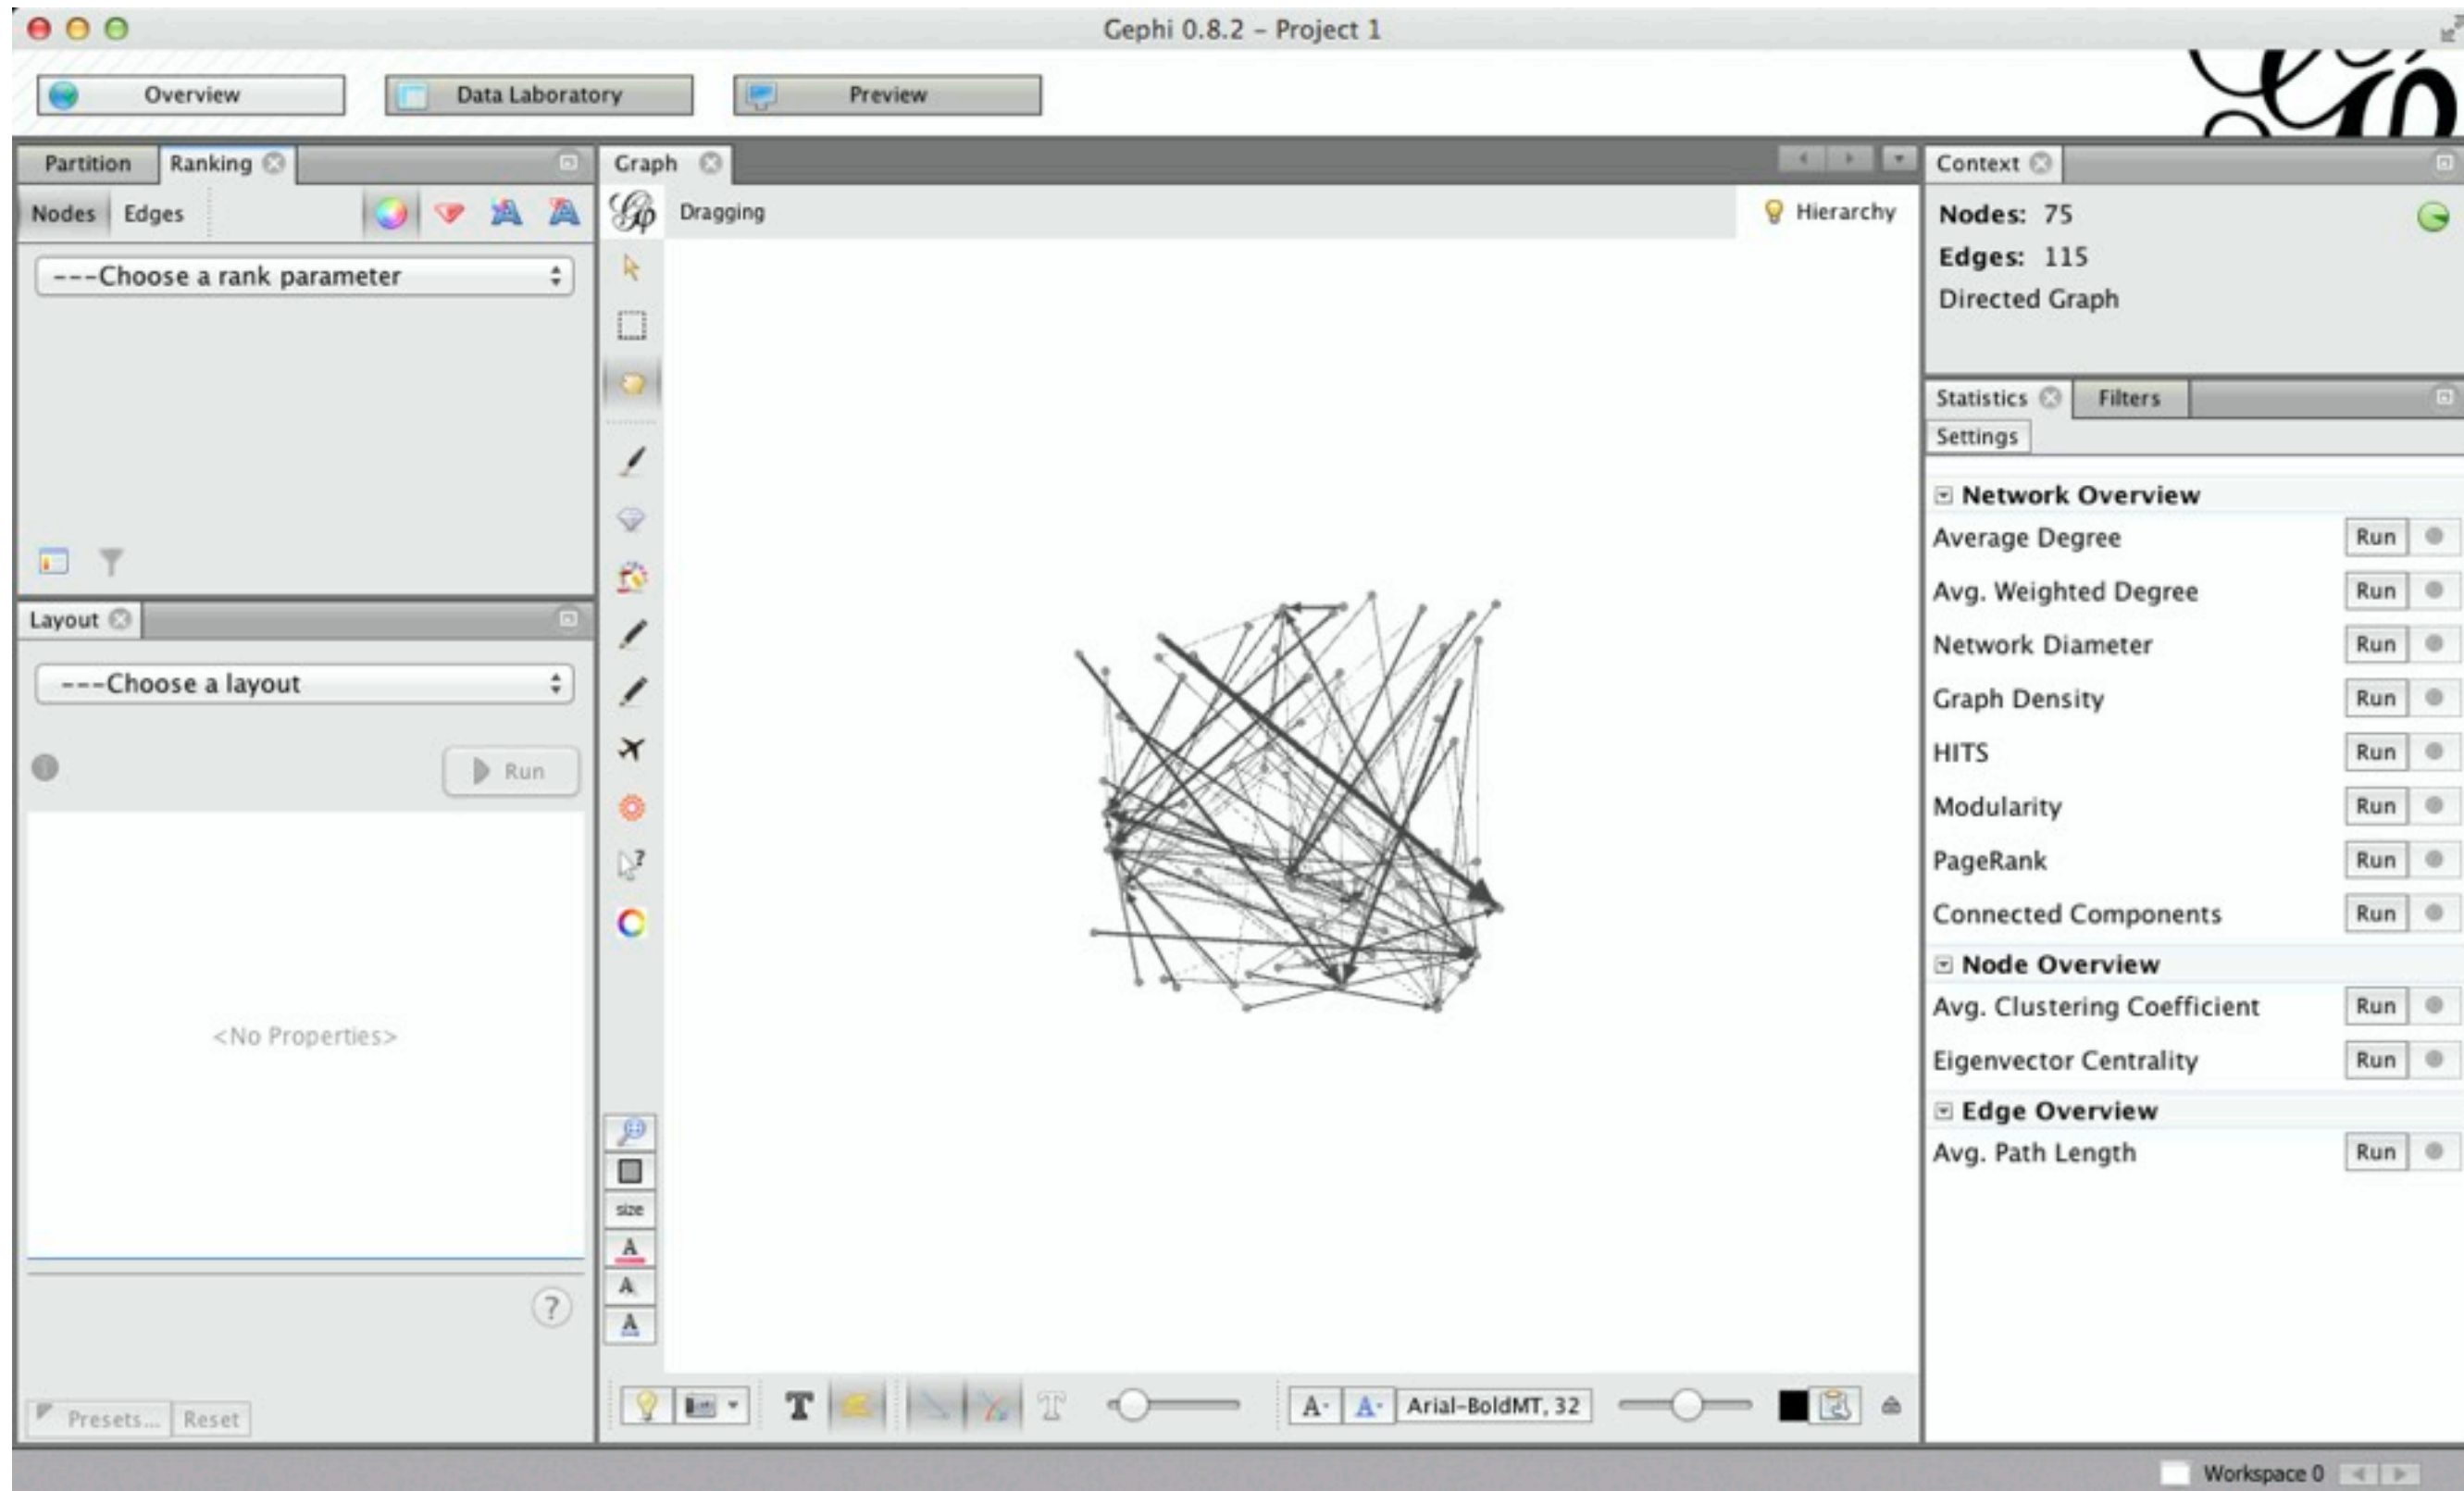

If you're following along...

- All the files are in <https://github.com/arnicas/TopicsPythonGephi>
- You should have a gephi appropriate files now, found in files/forggephi.gdf: <https://github.com/arnicas/TopicsPythonGephi/blob/master/files/forggephi.gdf>

Launch Gephi. “Open” on file menu... Use defaults you see here.

If all goes well, you should see something like this....

On the Data Laboratory Tab, you'll see what we imported.

Gephi 0.8.2 – Project 1

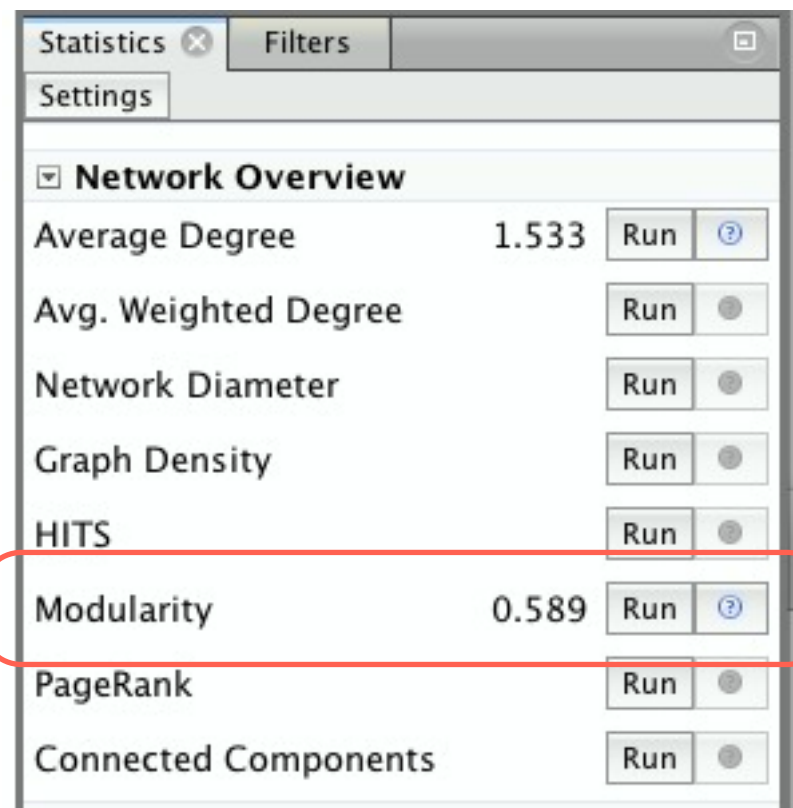

Overview Data Laboratory Preview

Over on the right side, you should have a “statistics” panel. “Run” a few of them and dismiss the dialogs. This adds stats to your data file you can use in layout and design. Run Modularity at least -- it’s a “community finding” algorithm.

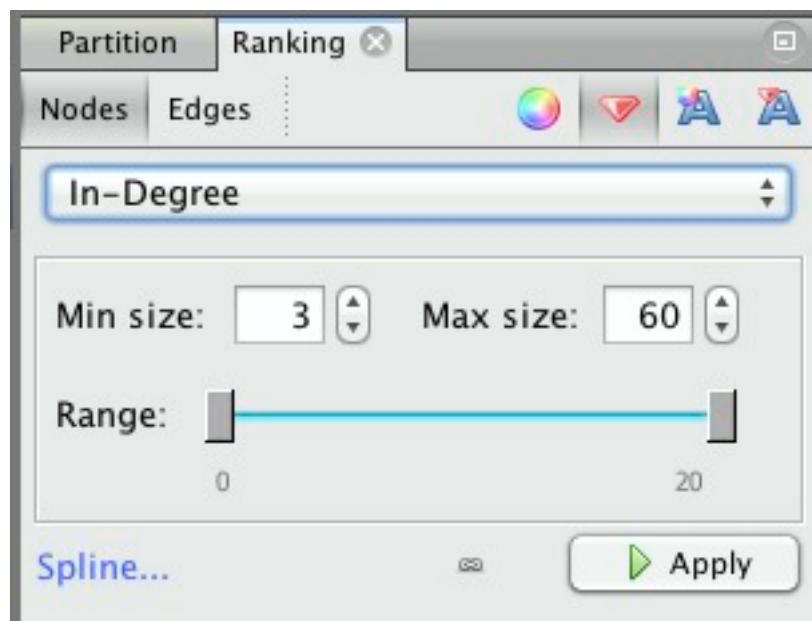

Now, on upper left side, in Ranking, select nodes, and the diamond. Pick “In-Degree” to size by.

1.

2.

3. after
Apply:

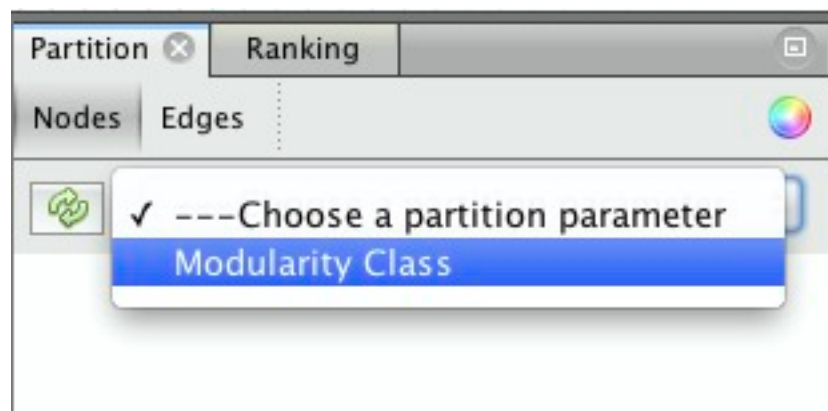

These are the nodes with the most “in arrows,” or highest in-degree. They are the “topics.”

Color by “Modularity”

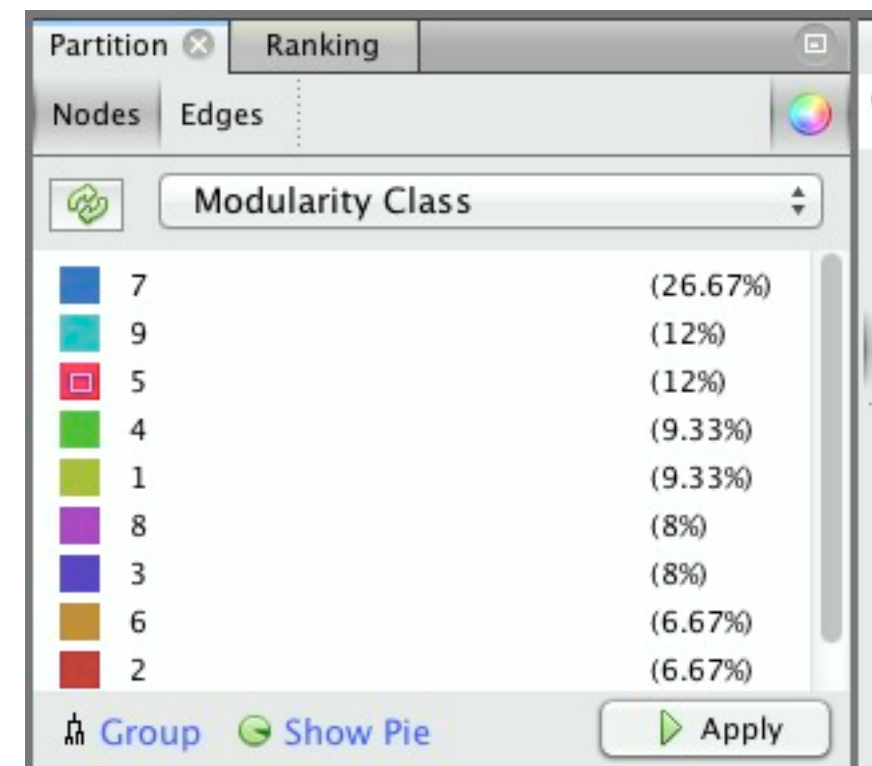

1. Hit green refresh arrow:

2. Then choose “Modularity Class” from menu:

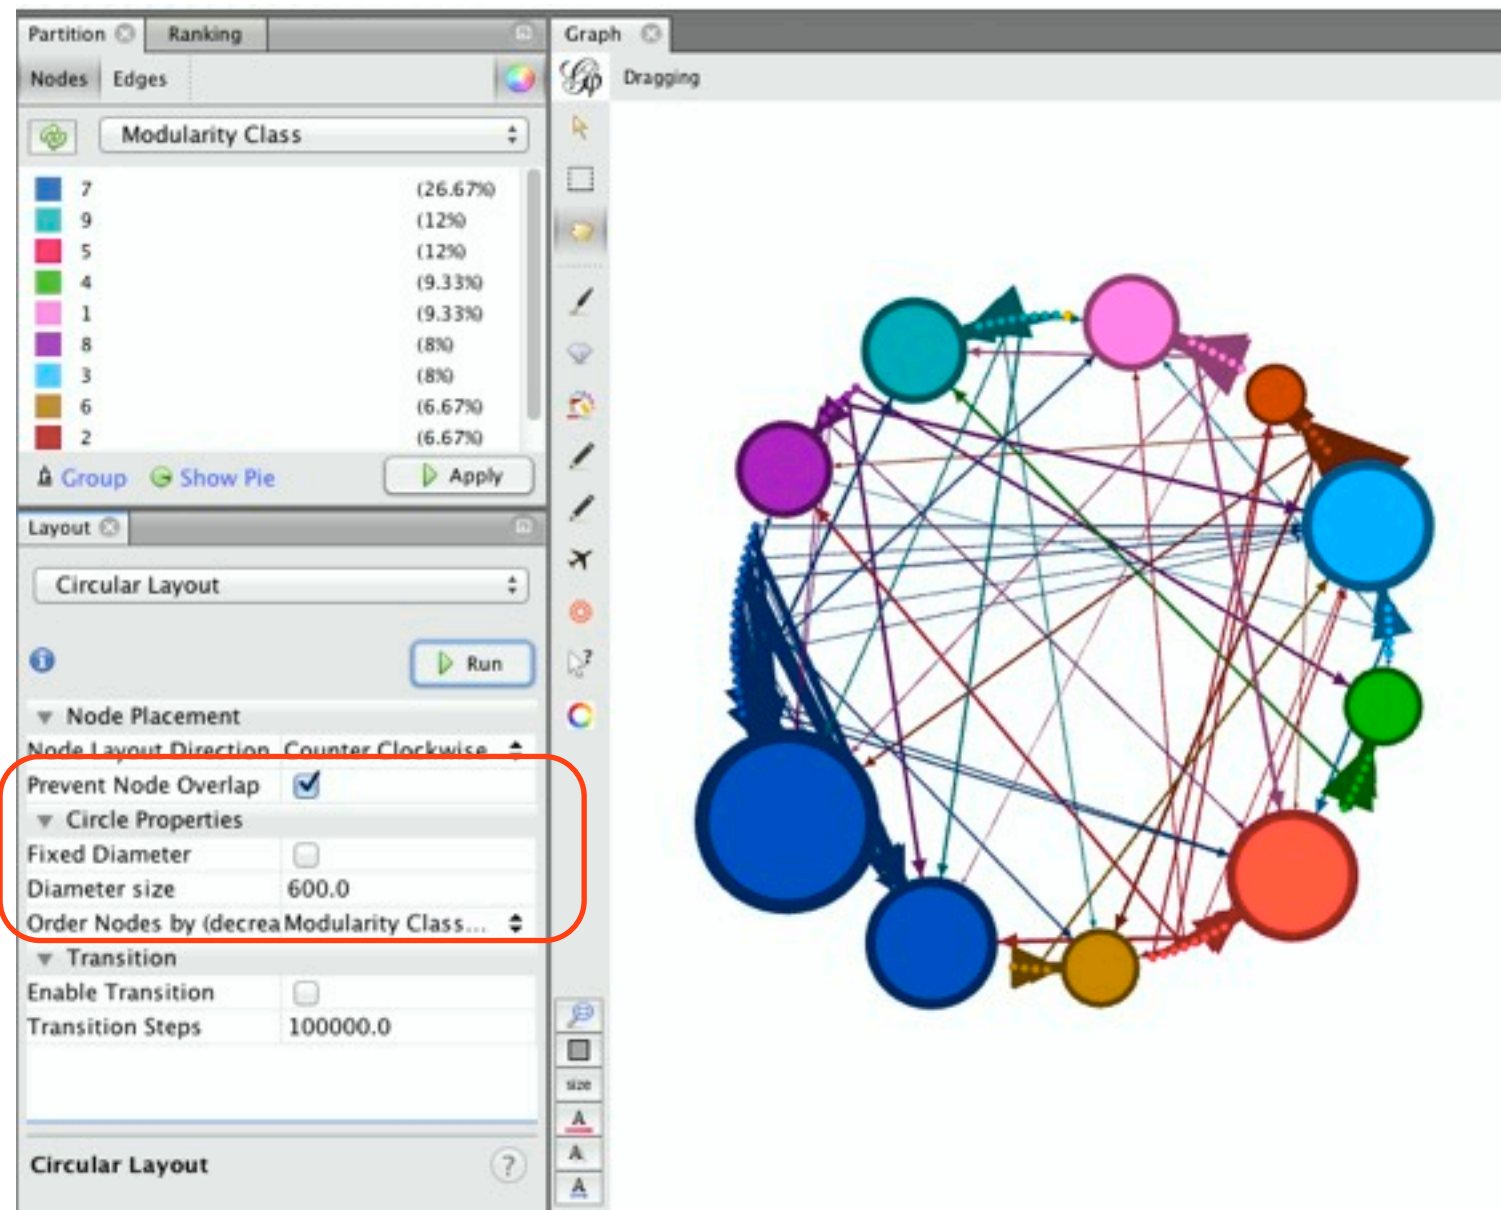

3. You’ll see the “groups” and random assigned colors. Click on a color to pick a new one. Make them as different as you can.

4. Then hit “Apply.”

Let's try to lay it out a bit...
Circular is nice for topics.
You'll need to hand-adjust in
any case.

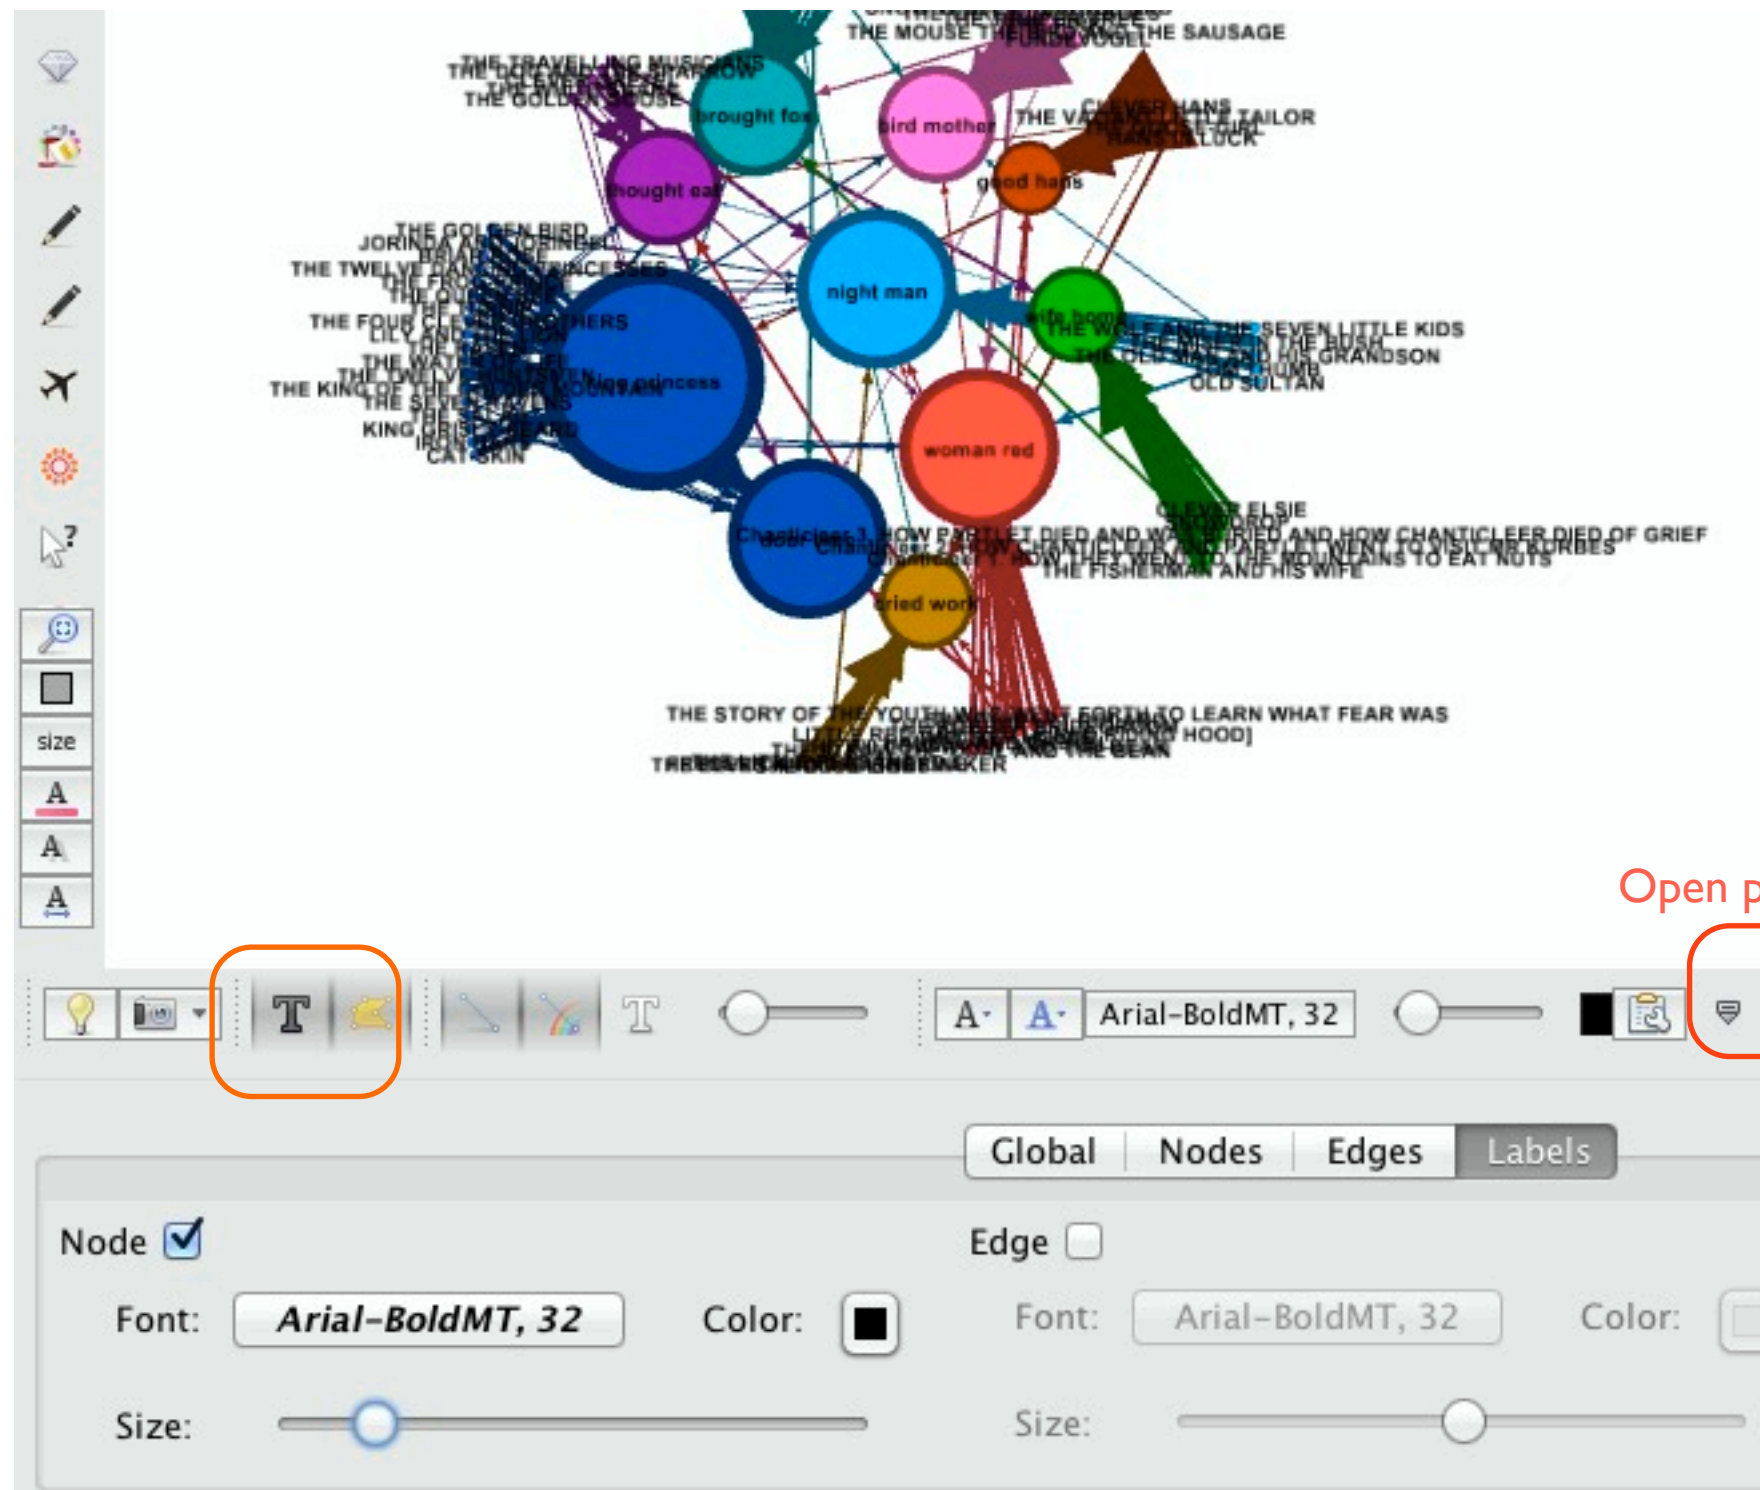

Order nodes by modularity
class!

Hand-tweak to
move the topic
nodes inside.

Turn on
labels and
adjust
sizes...

One option
is color by
destination
node.

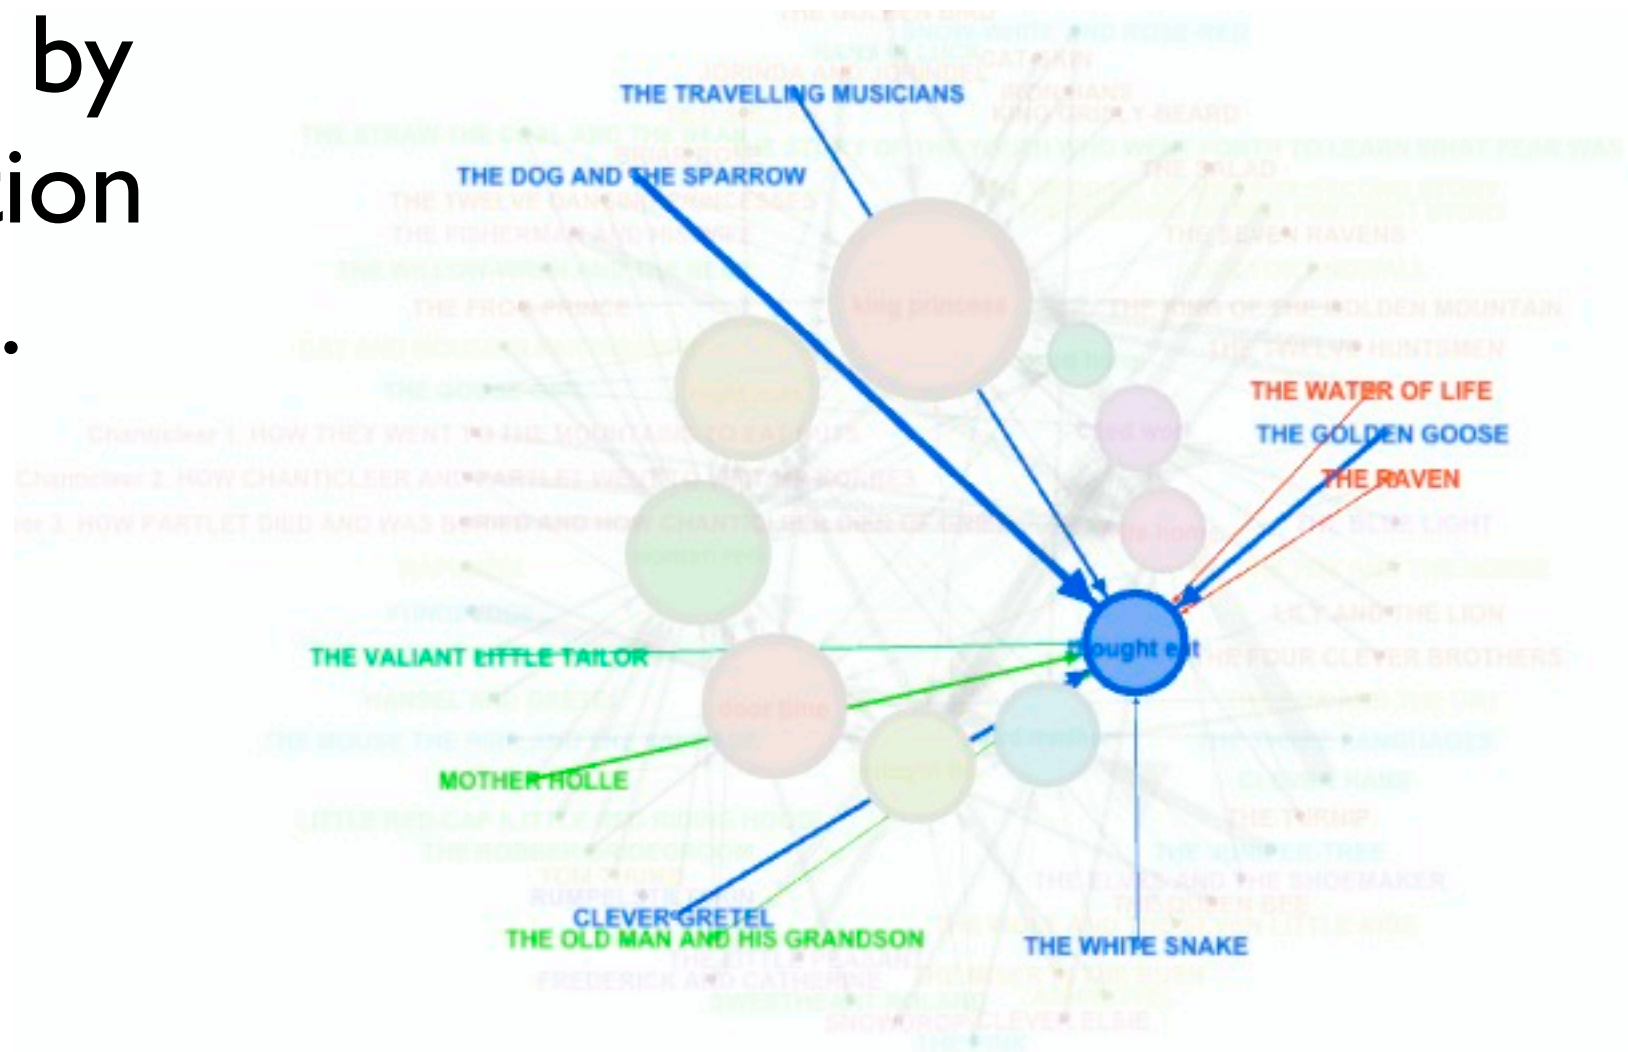

Diagram software interface showing settings for Nodes, Edges, and Labels. The 'Labels' tab is selected. The 'Node' section is checked, and the 'Edge' section is unchecked. The 'Size' dropdown is set to 'Scaled', and the 'Color' dropdown is set to 'Object' (highlighted with a red box). The 'Hide non-selected' checkbox is unchecked.

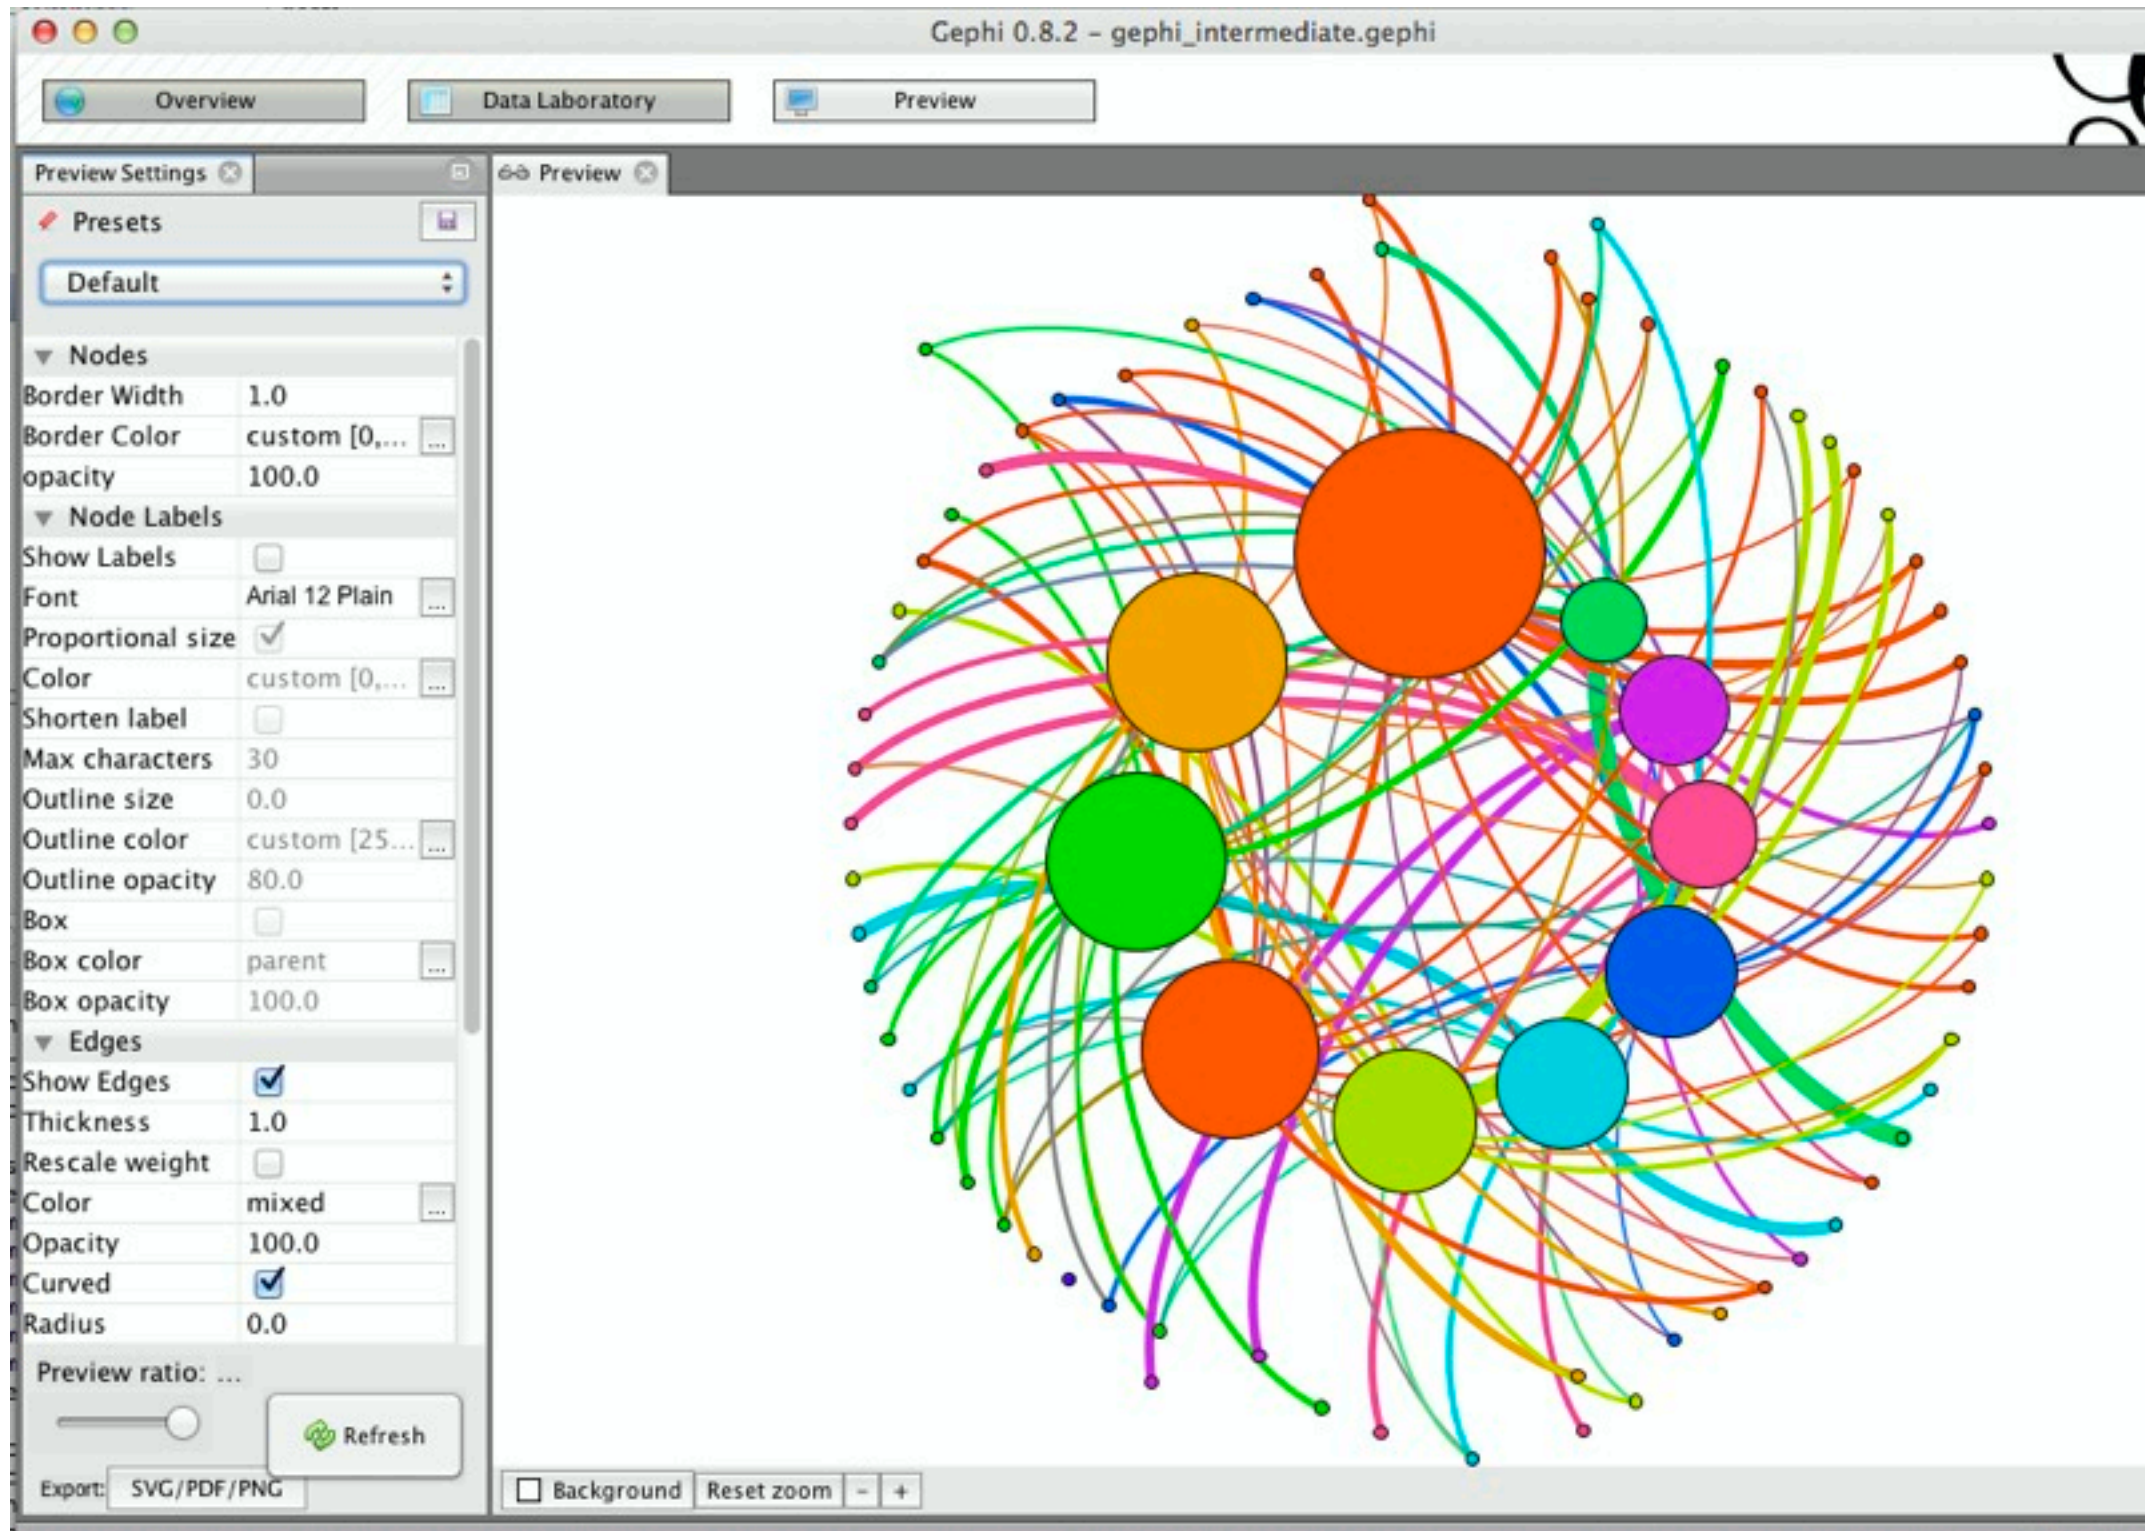

Global Nodes Edges Labels

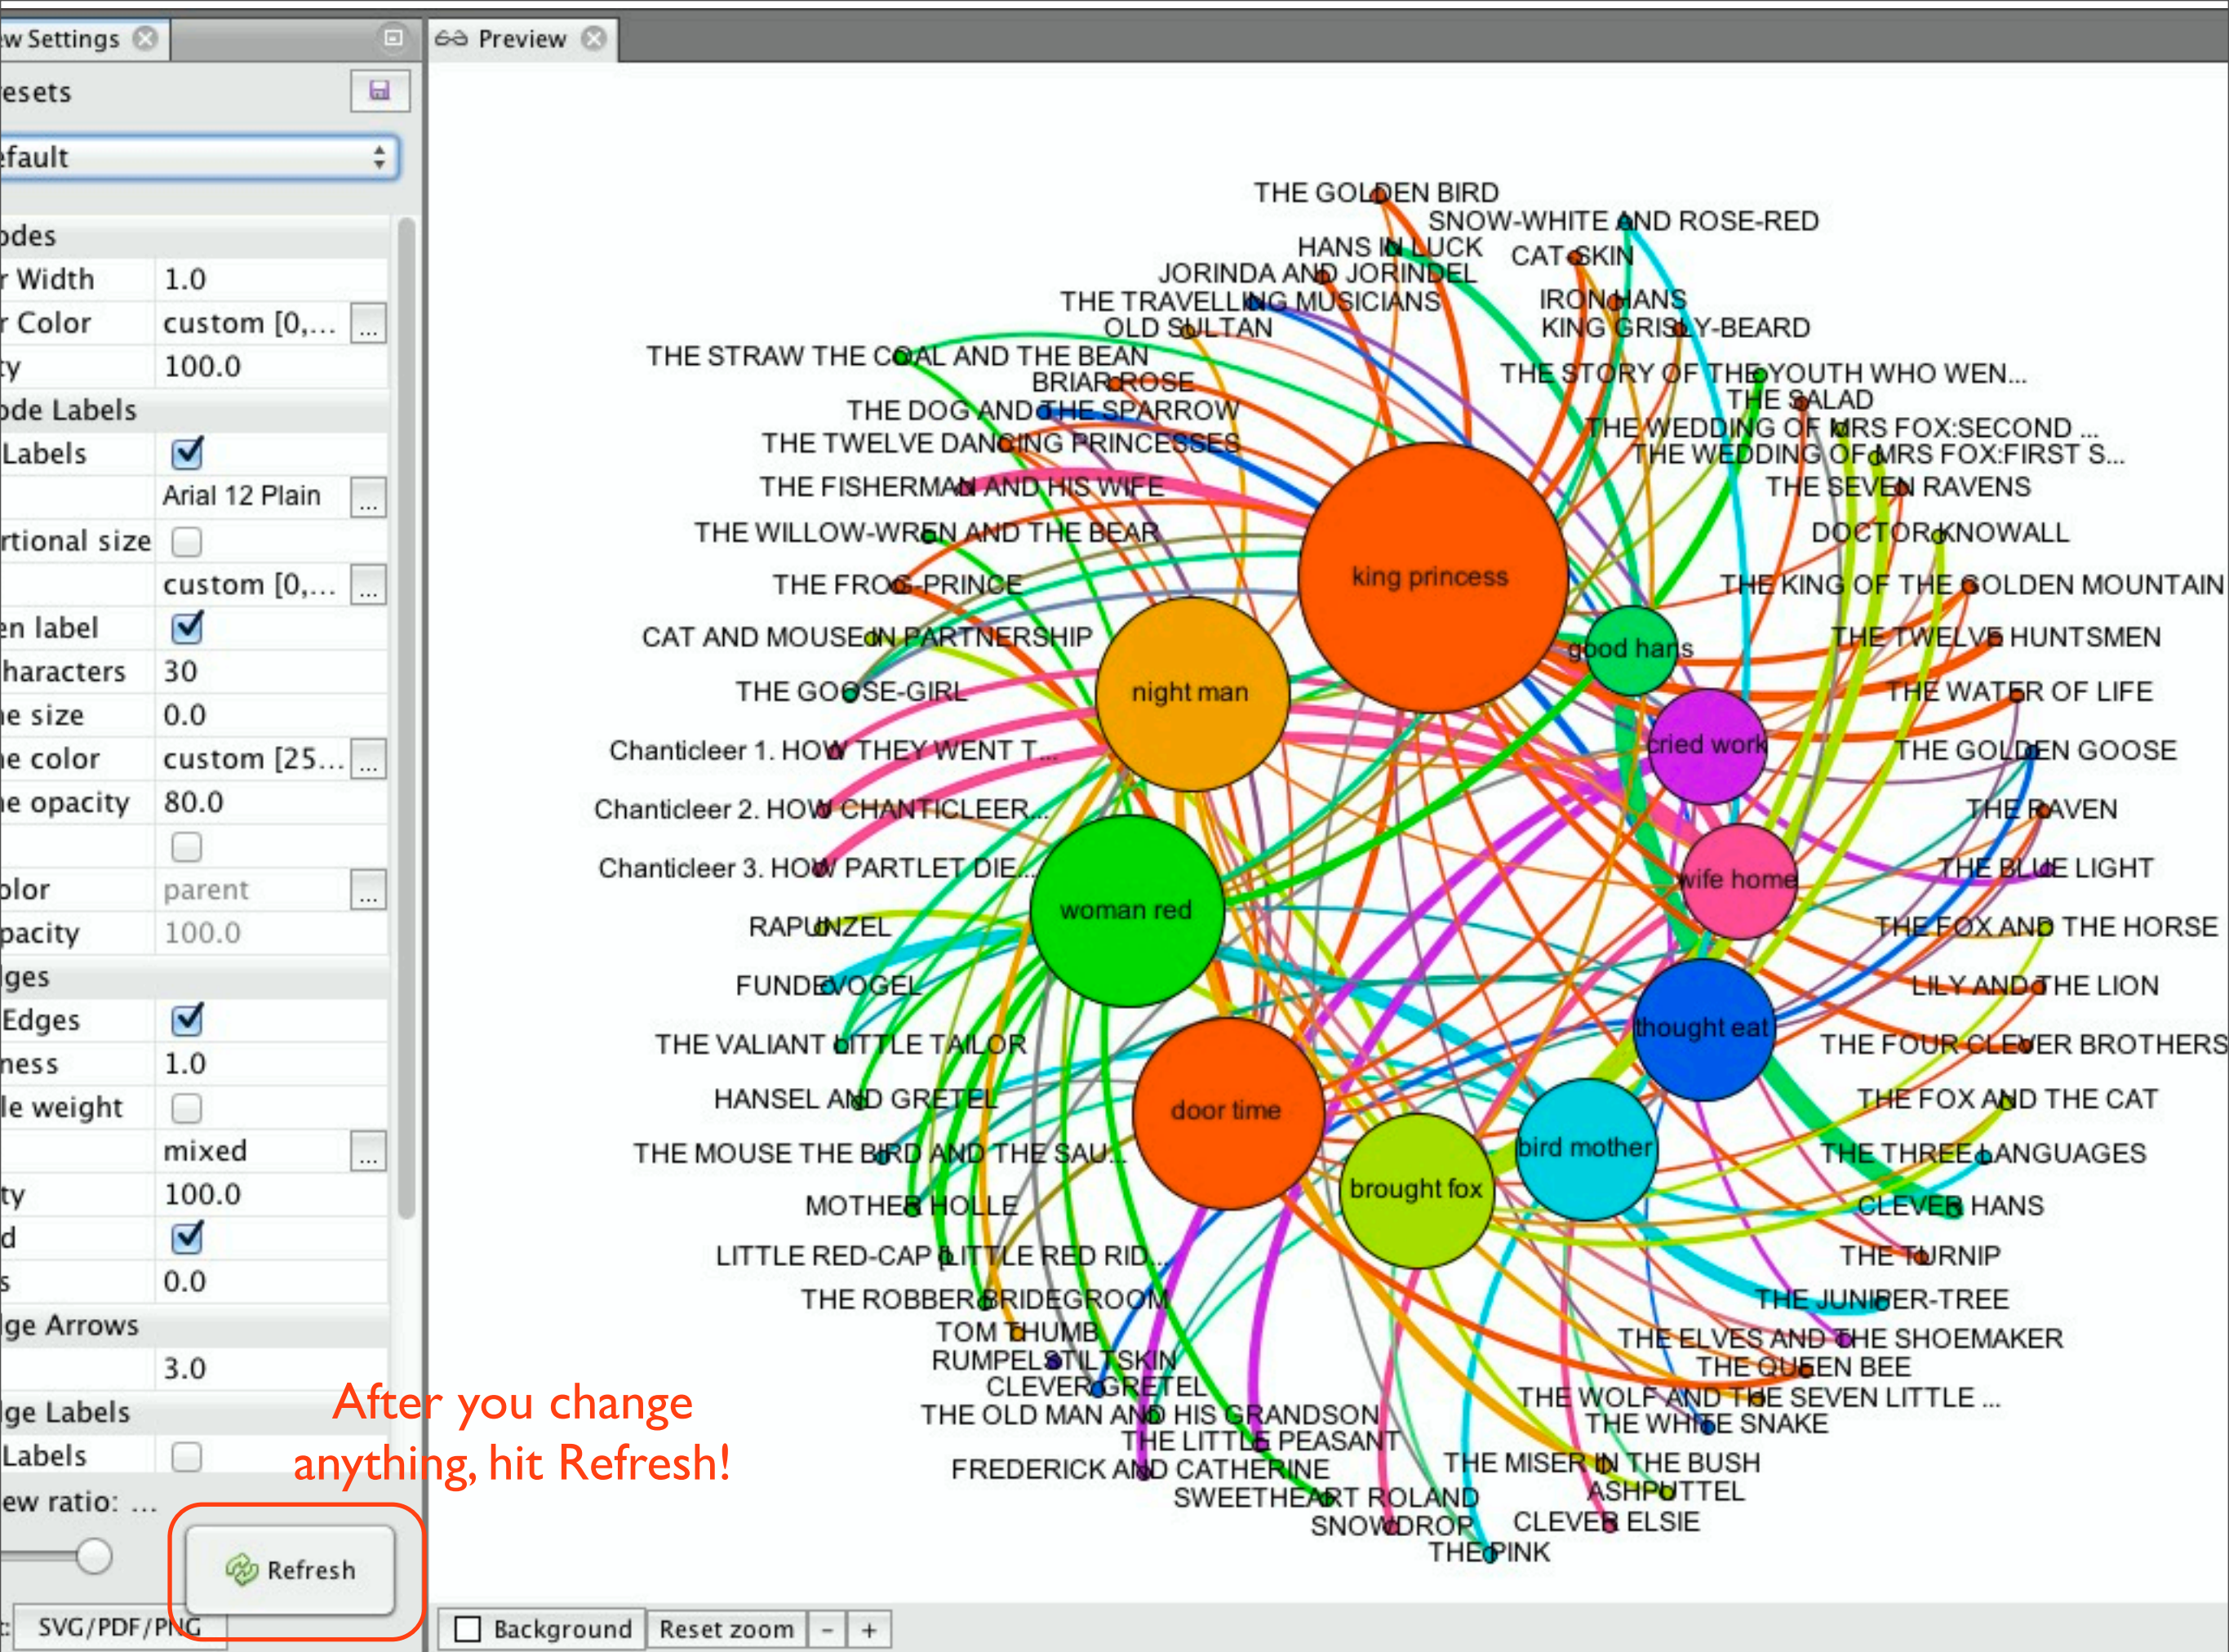

Node ☒ Edge ☐

Font: **Arial-BoldMT, 32** Color: ☐ Font: **Arial-BoldMT, 32** Color: ☐

Size: Size: Size: Scaled Color: Object Hide non-selected ☐

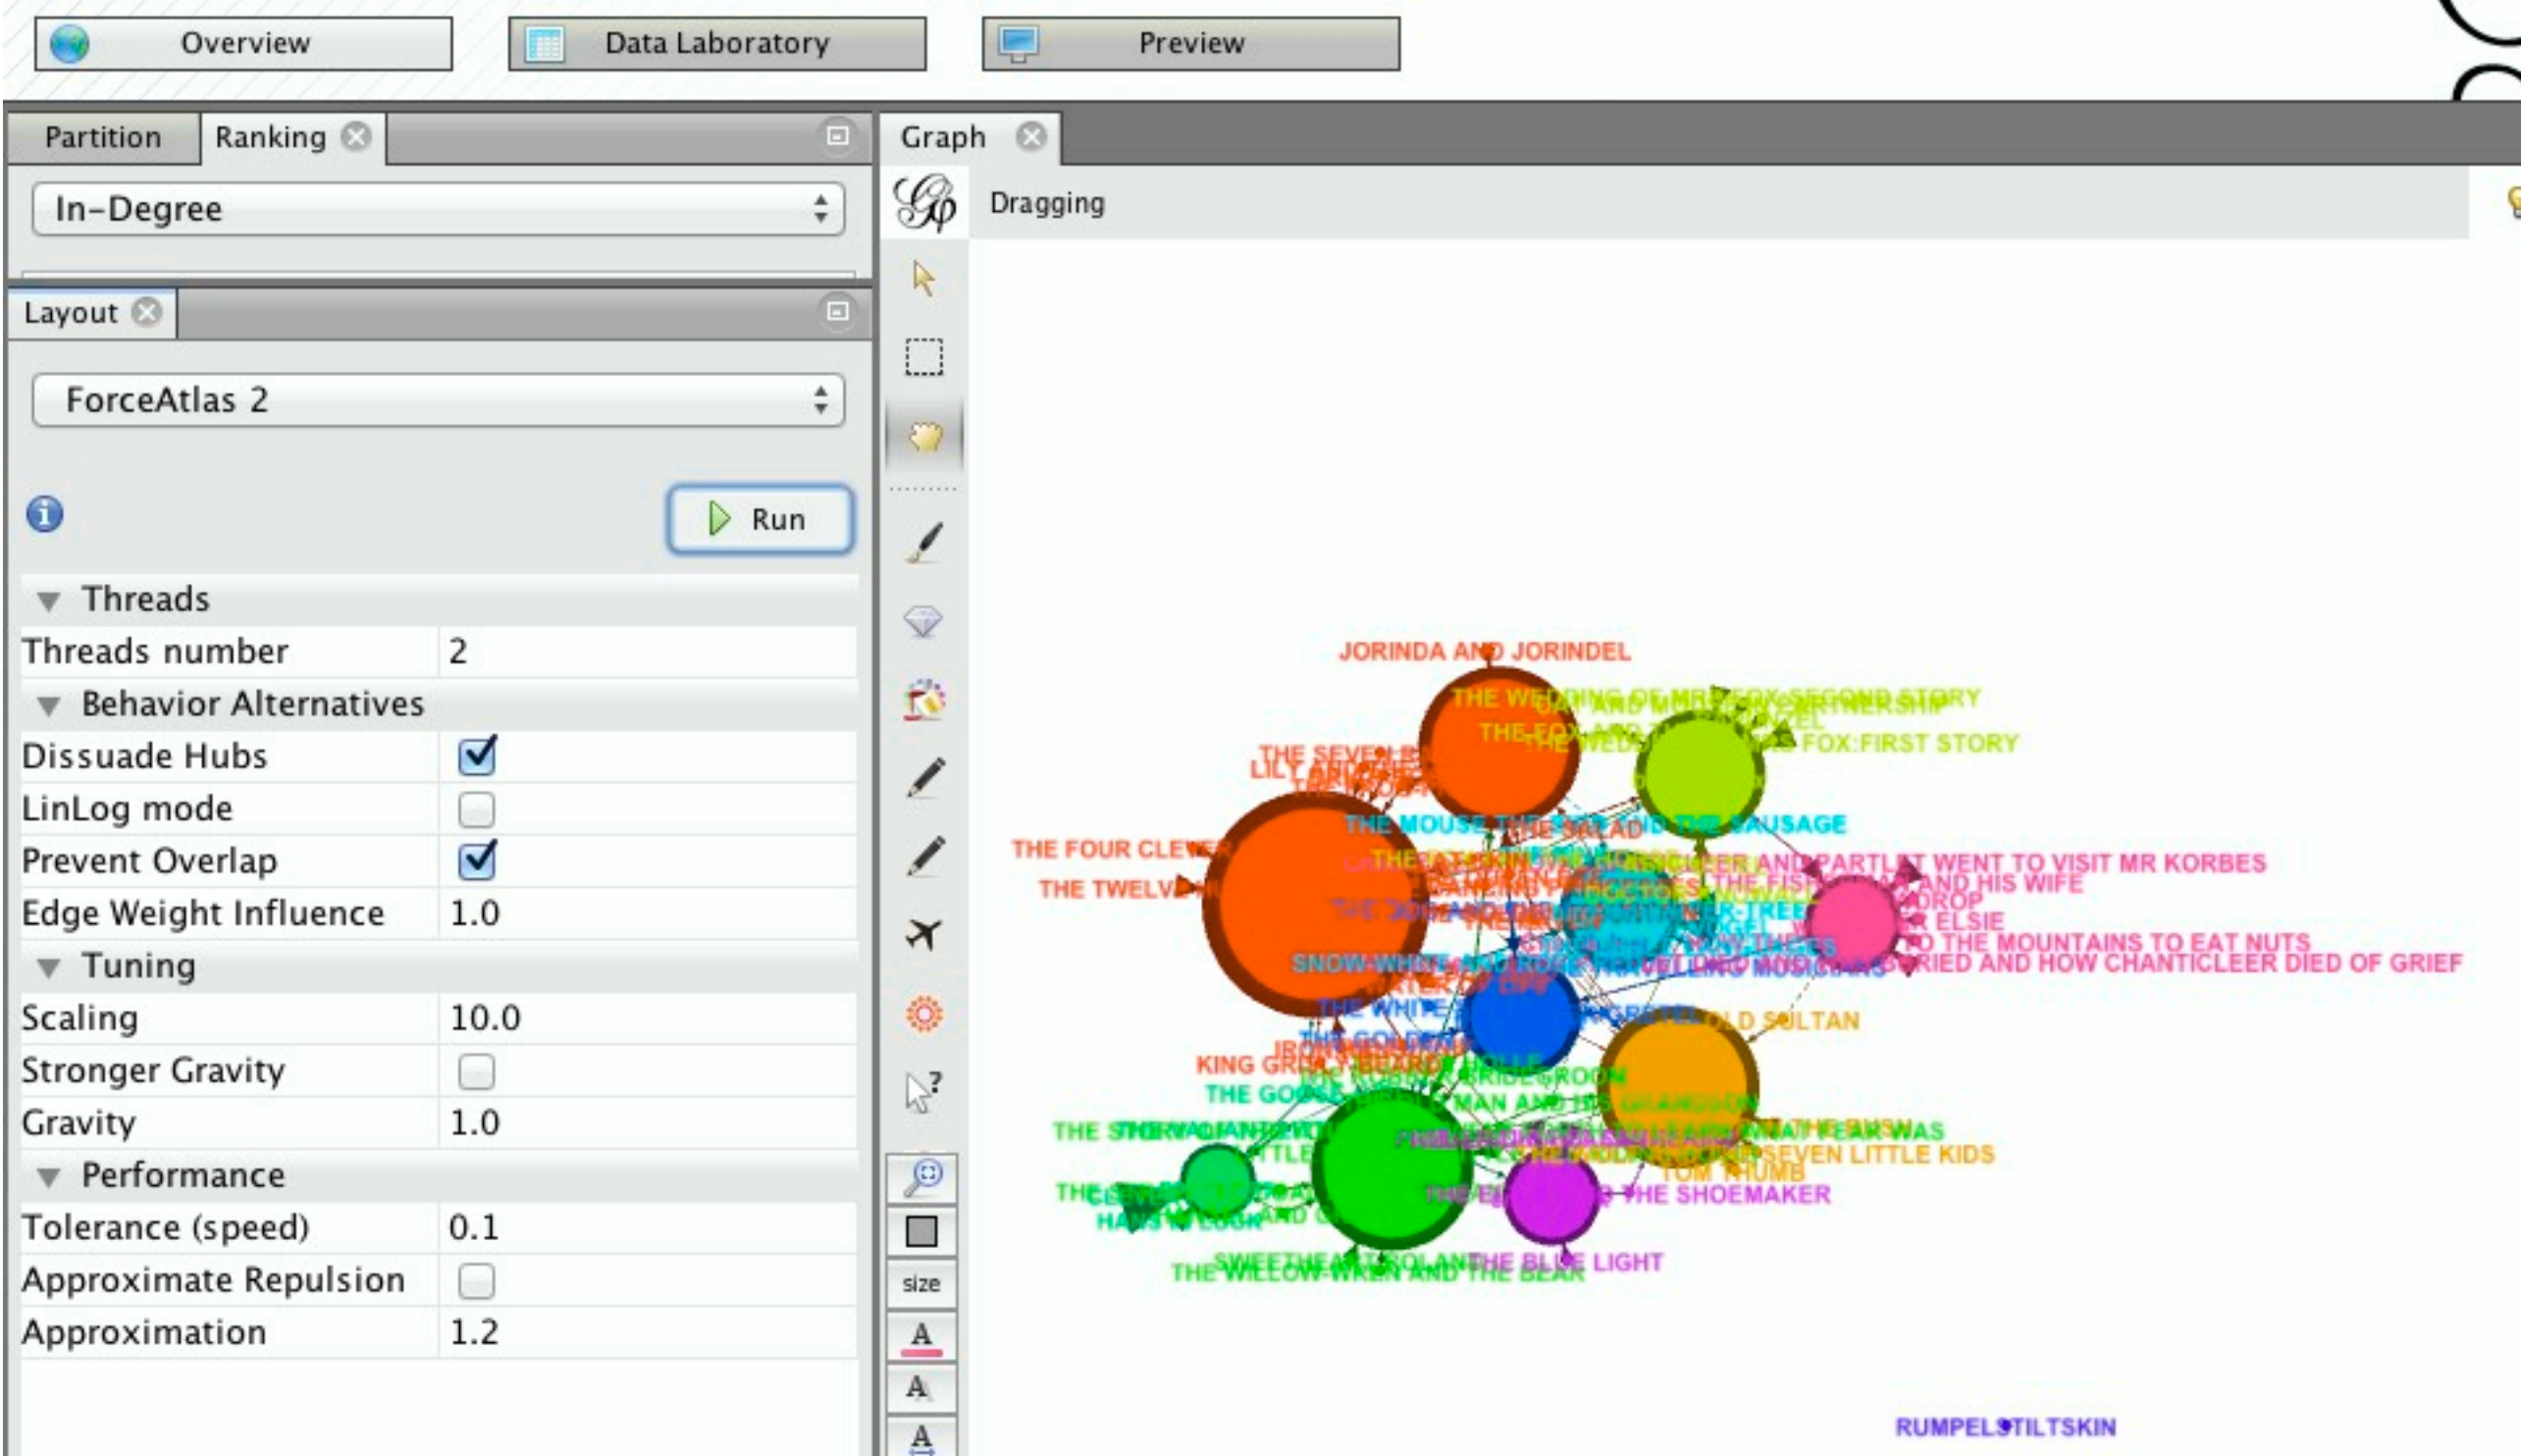

The “pretty” exportable version is on the Preview Tab. Finish adjusting in here.

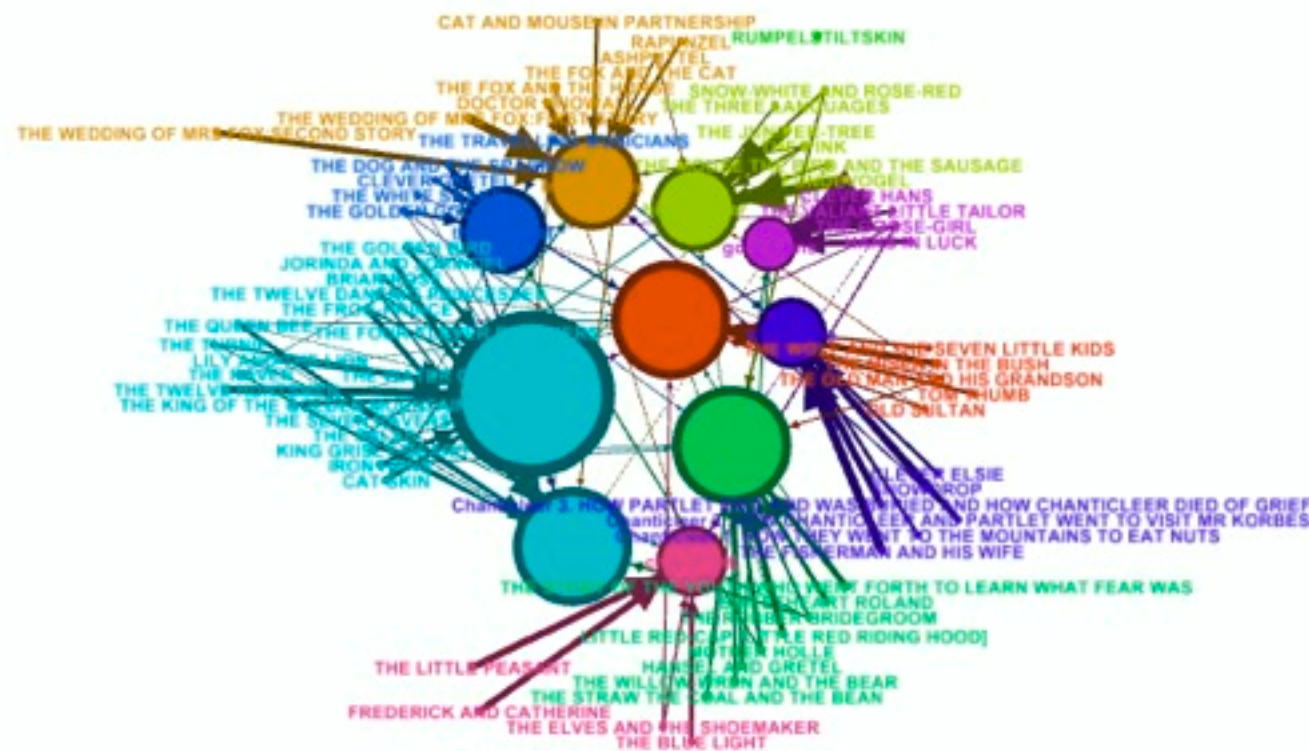

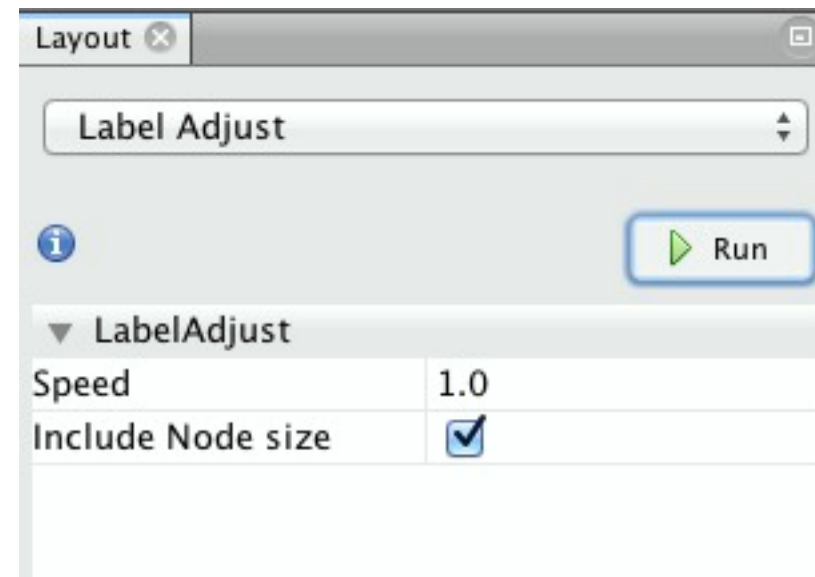

After you change anything, hit Refresh!

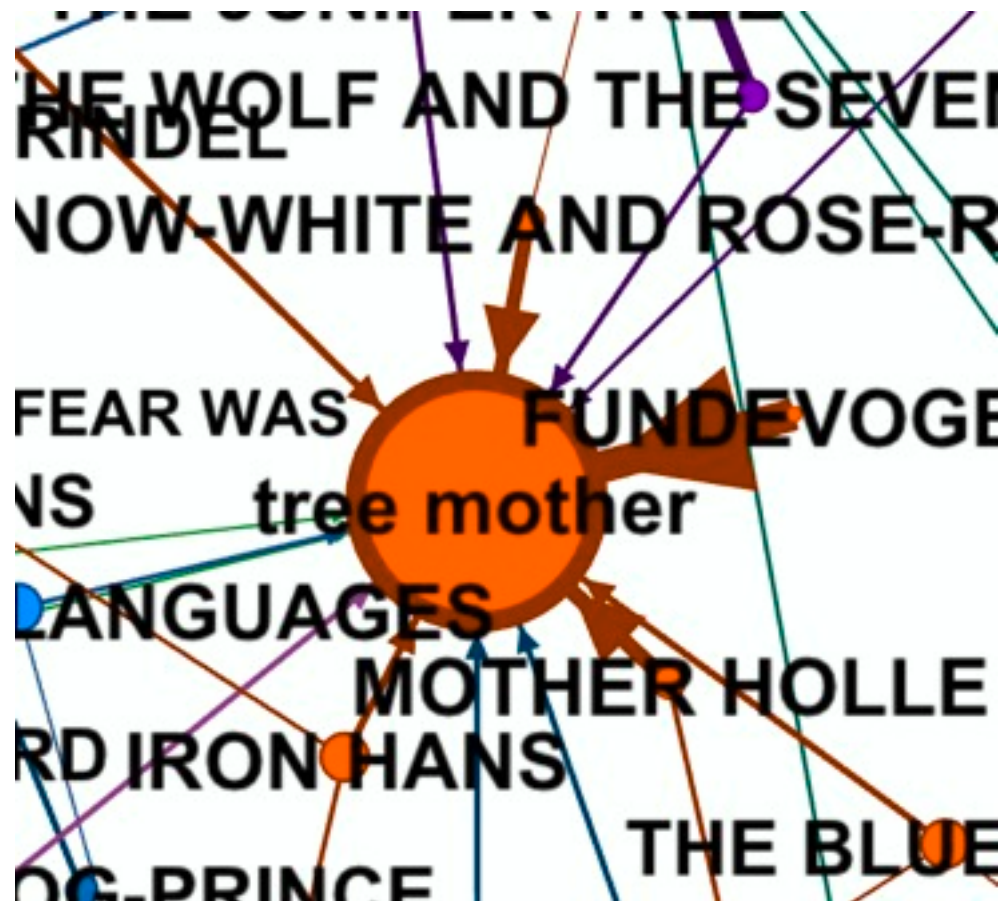

Another layout option is force-atlas2. Be careful with the settings! Anything unconnected will fly out.

Always use
Label Adjust is
you use Force
Atlas (or any
one, actually).

A nice final adjustment workflow is to zoom in on an area....

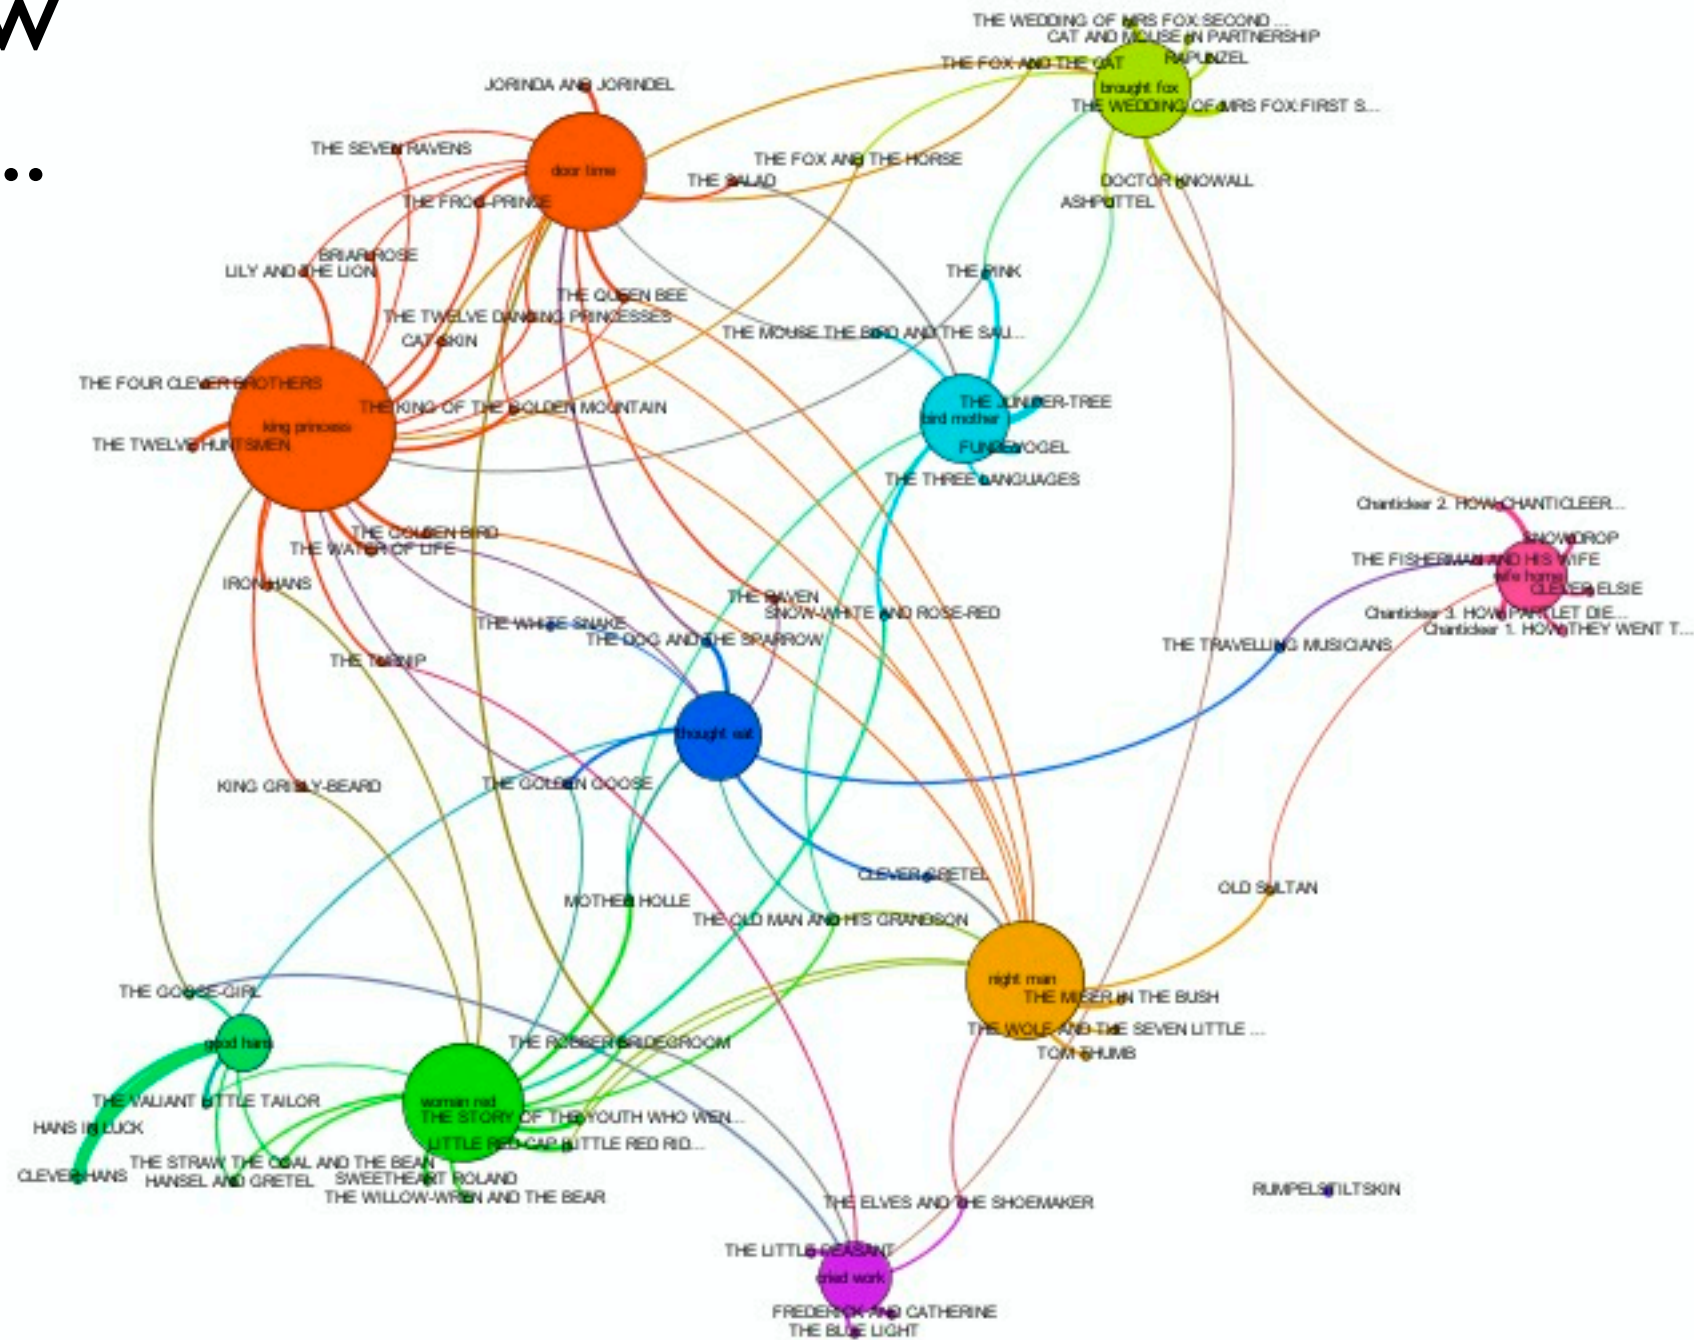

Turn off the labels if they're on...

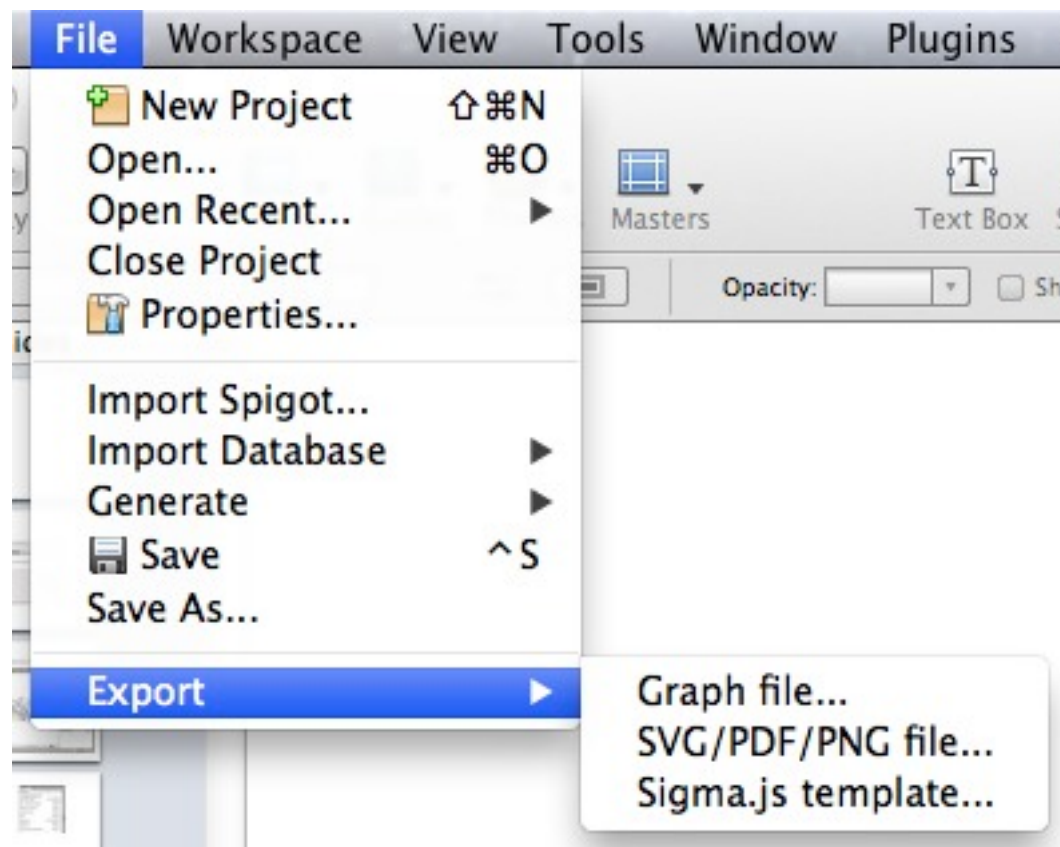

Now drag & move nodes around carefully to space things as you prefer...

Then switch back to Preview and hit REFRESH to see if you like that layout better.

A Force Layout in Preview mode...

To export to an interactive web project after your Layout, pick Export... Sigma.js template.

Put in whatever useful, informative text you can supply. I like “Dim” for Hover behavior. Let’s use Modularity Class for Group.

Sigma.js Export

Export to Sigma.js template

/Users/lynn/Documents/Talks/TopicsPythonGephi/files Browse...

Legend

Node* Topic/Story

Edge* Strength

Color* Community

Branding

Logo (url)

Link

Author* Lynn Cherny

Title* Jell of Grimms

Features

☒ Include search? ☒ Group edges by direction?

Hover behavior Dim

Group Selector? Modularity Class

Image attribute? None (Default)

Attributes

Coming soon

Short Description*

An example of exporting topic model relations from Gephi using the Sigma.js plugin.

Long Description*

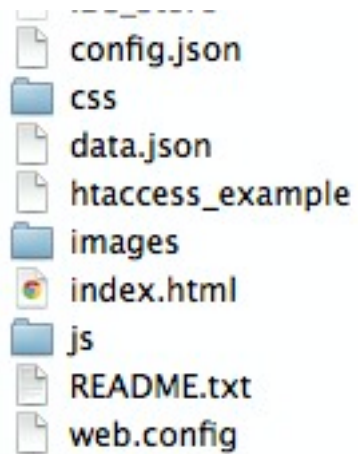

An example of a sigma.js export of Grimm's Fairytales topics – chapters mapped to topics.

☐ Replace node ids with numbers

Cancel OK

It will output a “network” folder - pick where!

The
“network”
folder has
these:

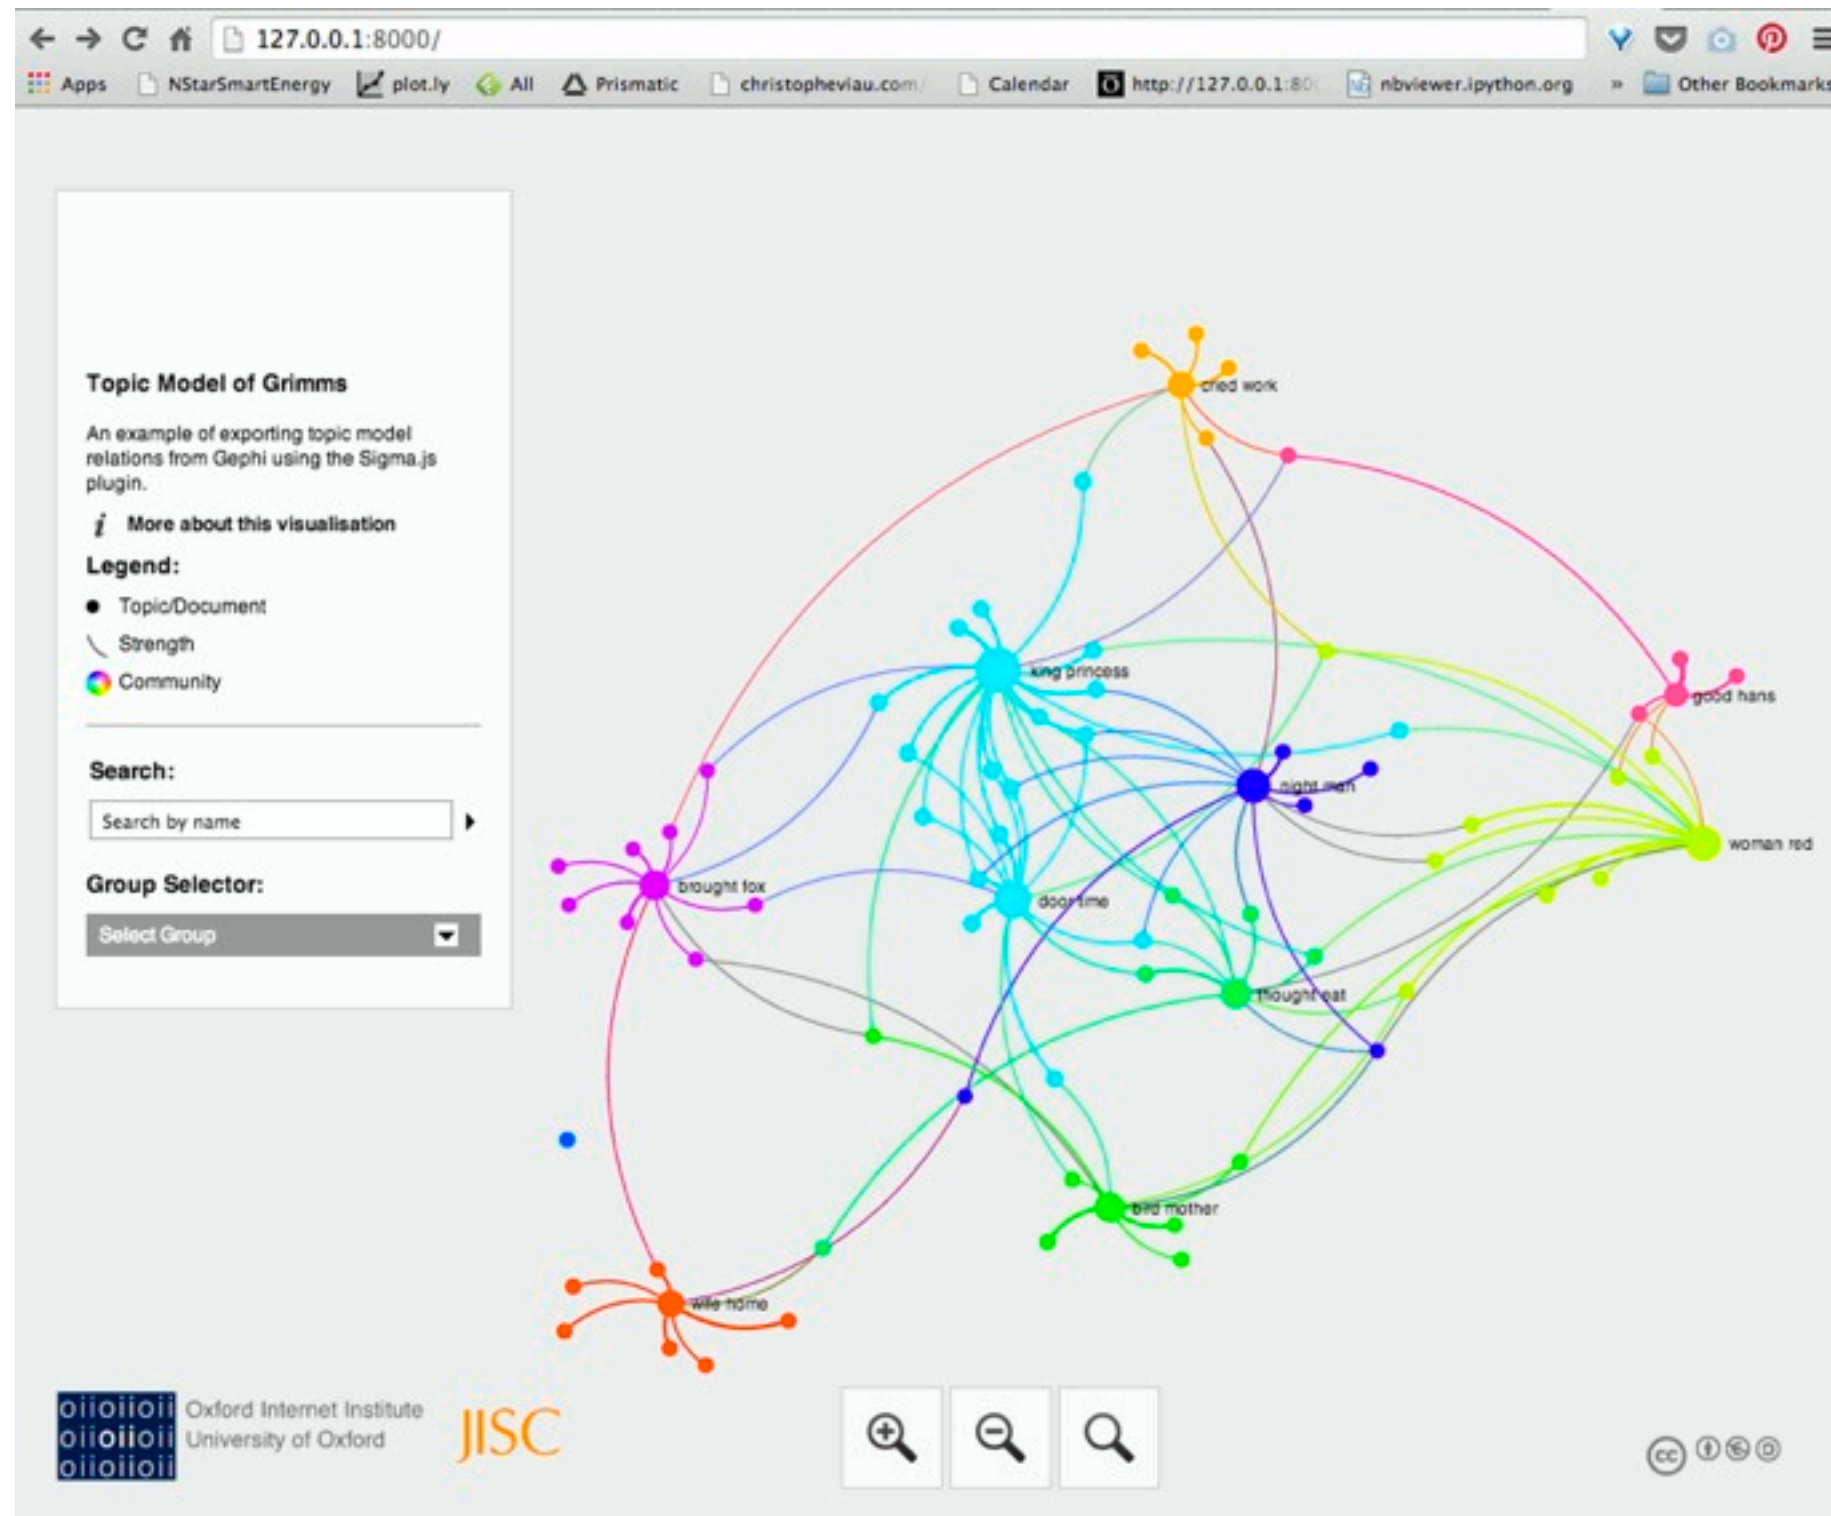

```
config.json
17   "colorLabel": "Community",
18   "nodeLabel": "Topic/Document"
19 },
20 "features": {
21   "search": true,
22   "groupSelectorAttribute": "Modularity Class",
23   "hoverBehavior": "default"
24 },
25 "informationPanel": {
26   "imageAttribute": false,
27   "groupByEdgeDirection": true
28 },
29 "sigma": {
30   "graphProperties": {
31     "minEdgeSize": 1,
32     "maxNodeSize": 20,
33     "maxEdgeSize": 8,
34     "minNodeSize": 7
35   },
36   "drawingProperties": {
37     "labelThreshold": 10,
38     "hoverFontStyle": "bold",
39     "defaultEdgeType": "curve",
40     "defaultLabelColor": "#000",
41     "defaultLabelHoverColor": "#fff",
42     "defaultLabelSize": 14,
43     "activeFontStyle": "bold",
44     "fontStyle": "bold",
45     "defaultHoverLabelBGColor": "#002147",
46     "defaultLabelBGColor": "#ddd"
47   },
48   "mouseProperties": {
49     "minRatio": 0.75,
50     "maxRatio": 20
51   }
52 }
53 }
```

Edit config.json to
increase some
sizes:

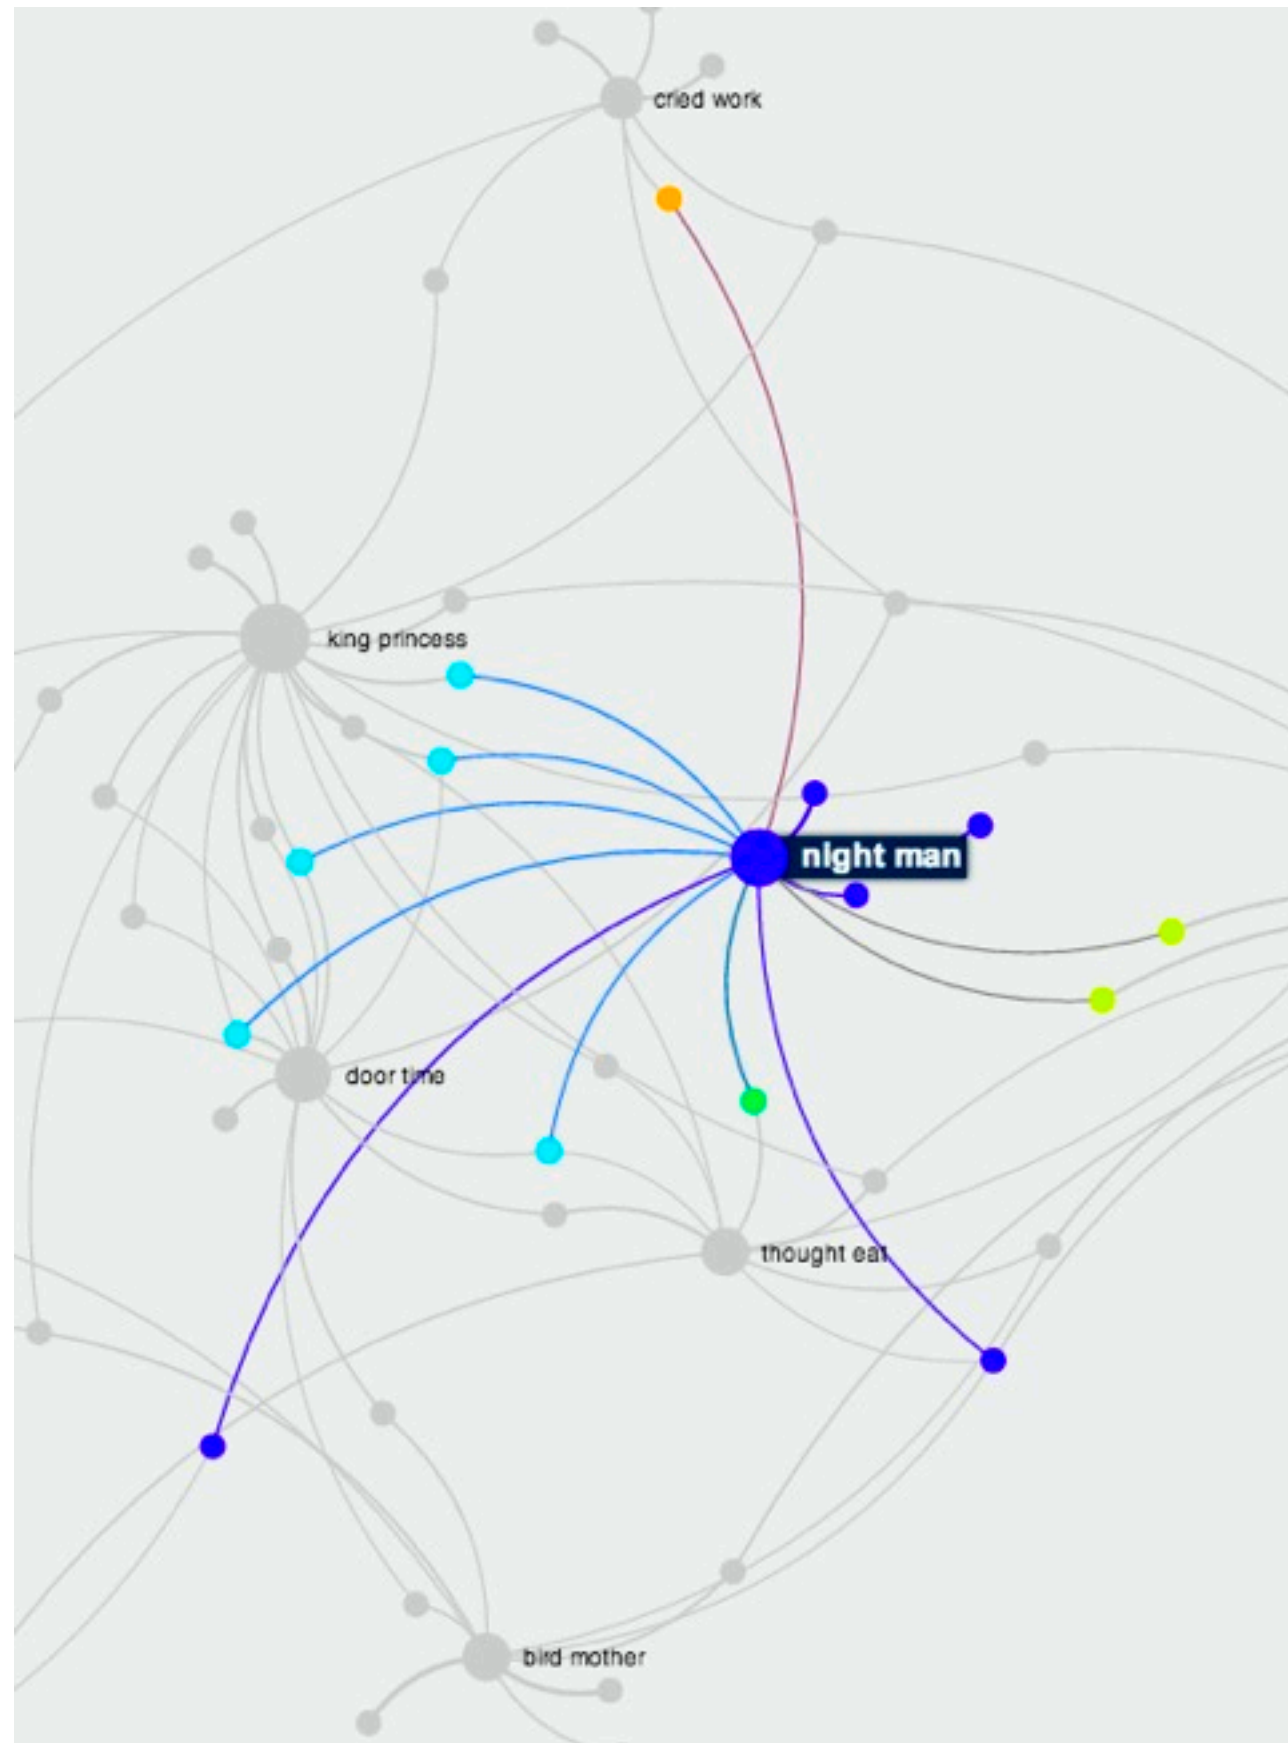

But decrease labelThreshold to maybe 7...

Move your network folder to a web server or start one locally:

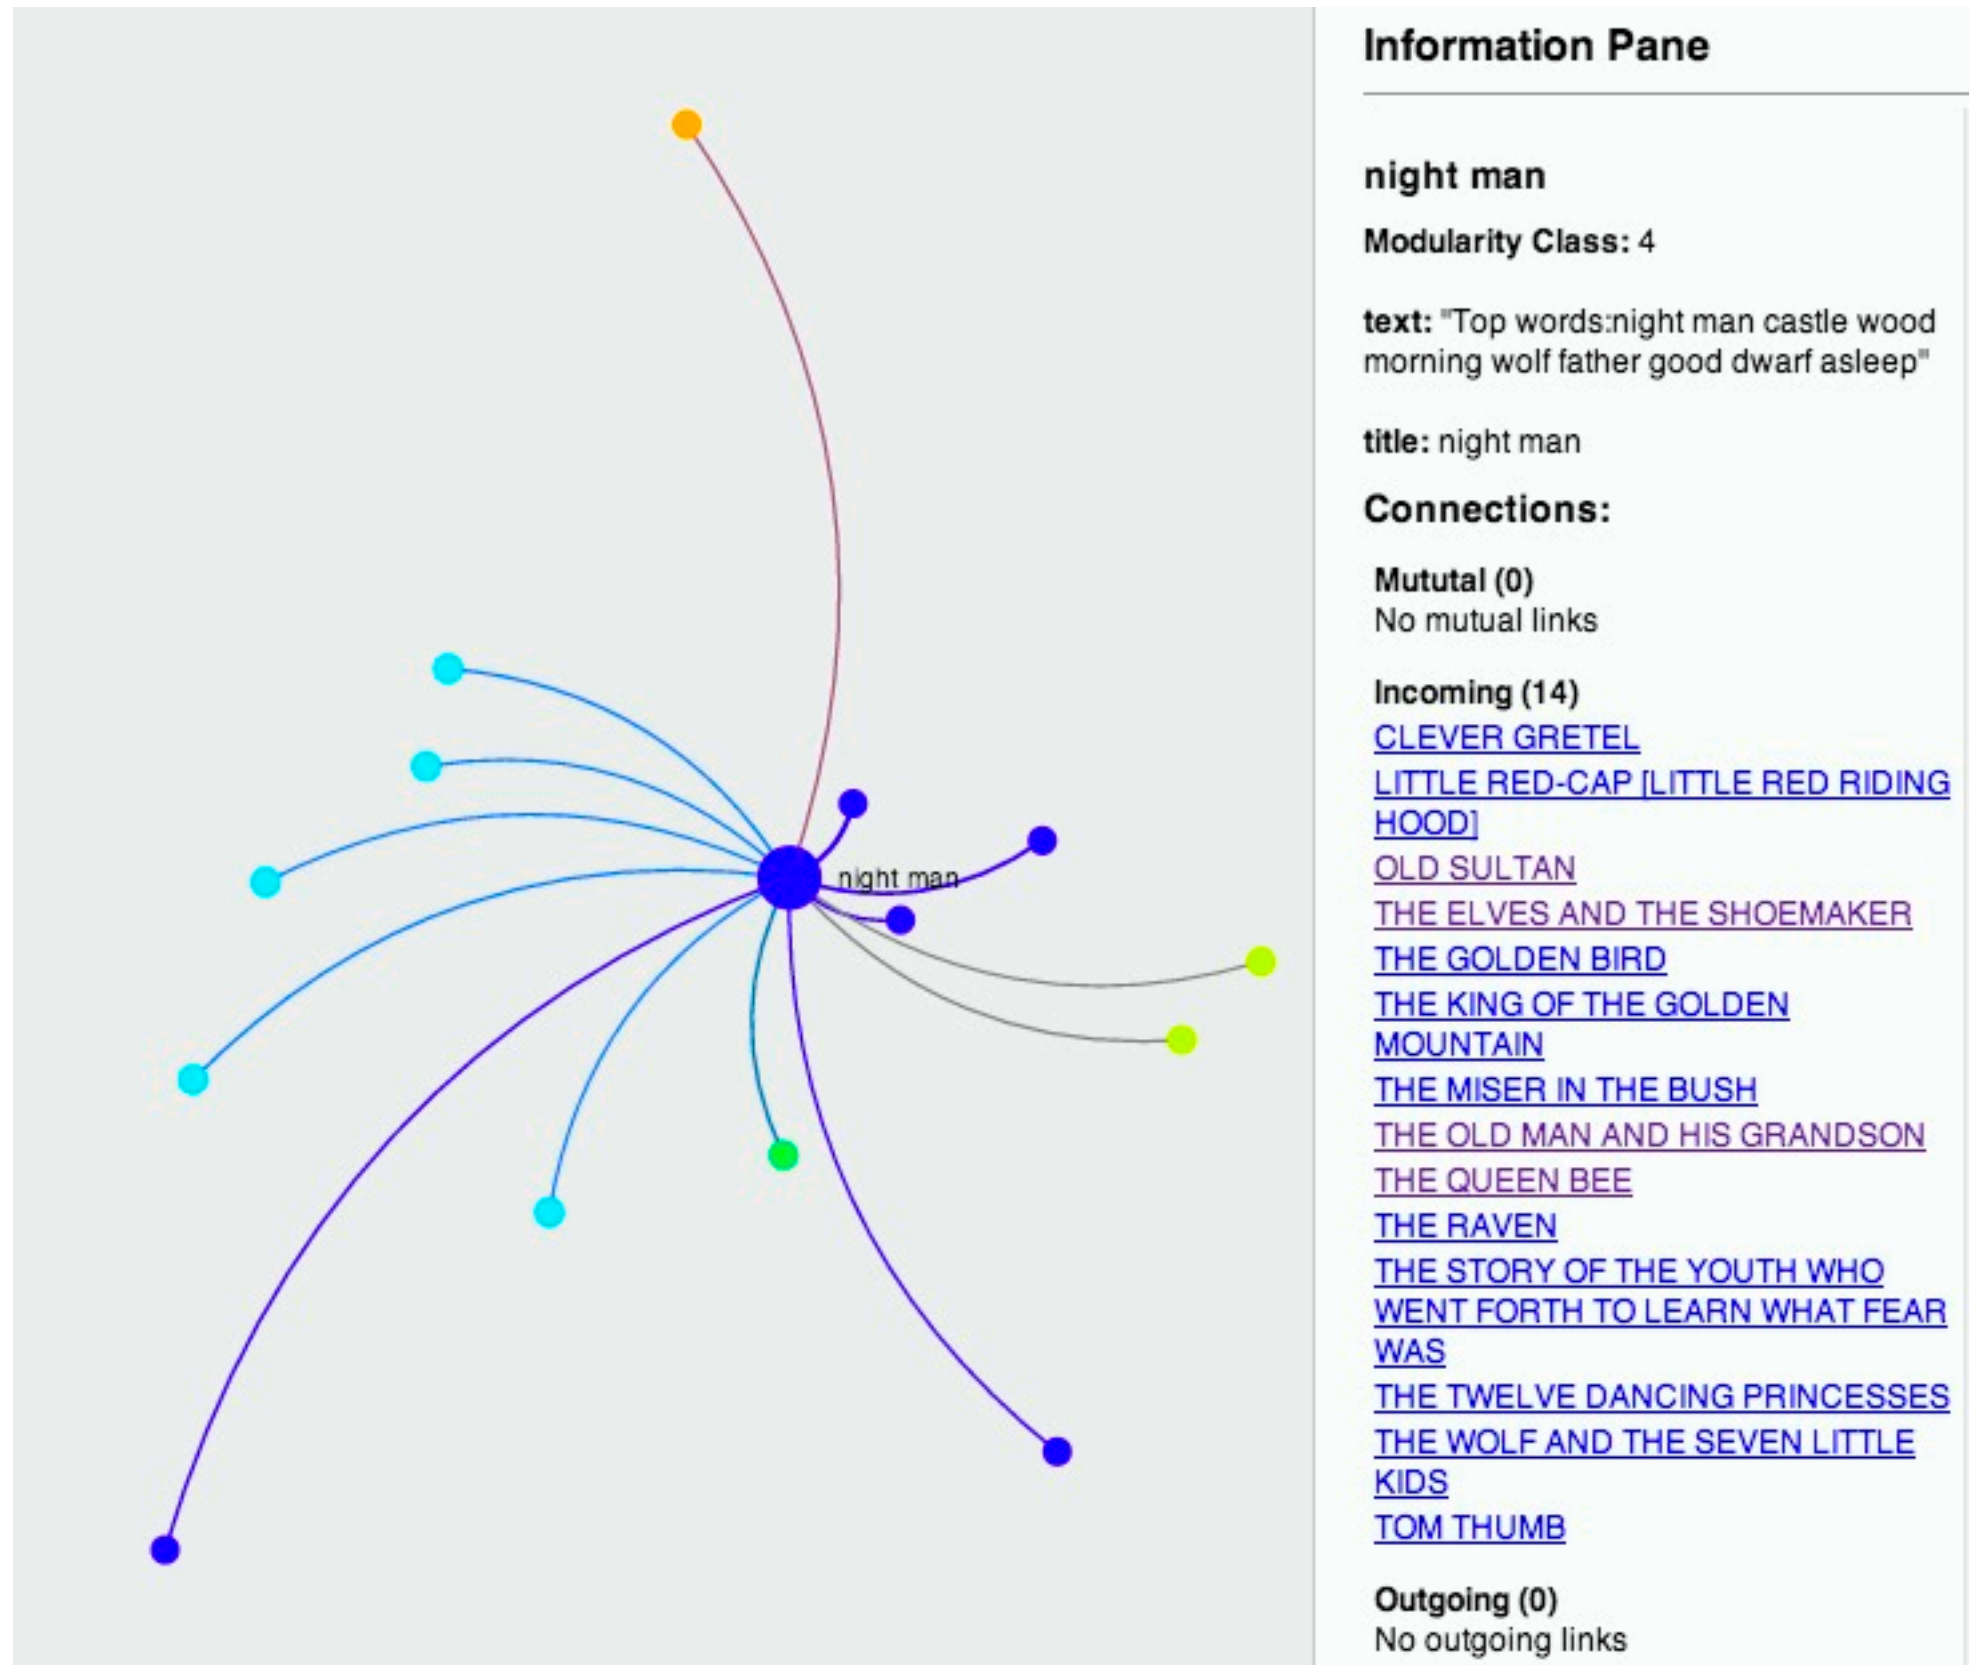

```
new-host-2:files lynn$ cd network
new-host-2:network lynn$ python -m SimpleHTTPServer 8000
Serving HTTP on 0.0.0.0 port 8000 ...
127.0.0.1 - - [30/Mar/2014 15:45:06] "GET / HTTP/1.1" 200 -
127.0.0.1 - - [30/Mar/2014 15:45:07] "GET /js/jquery/jquery.min.js HTTP/1.1" 200 -
...
```

At this level, rollovers dim unconnected nodes, showing only connected nodes. Only the largest node labels are visible (topics).

Clicking
gives you
info on the
right side,
including
the text
we
uploaded
to the
graph file
from
python!

Information Pane

CLEVER GRETEL

Modularity Class: 8

text: " Chapter CLEVER GRETEL There was once a cook named Gretel who wore shoes with red heels and when she walked out with them on she turned herself this way and that was quite happy and thought: 'You certainly are a pretty girl!' And when she came home she drank in her gladness of heart a draught of wine and as wine excites a desire to eat she tasted the..."

The groups
are the
modularity
classes
found. You
can search
for a node
name too...

As a last cleanup step, consider using the network to rejigger your names and labels.

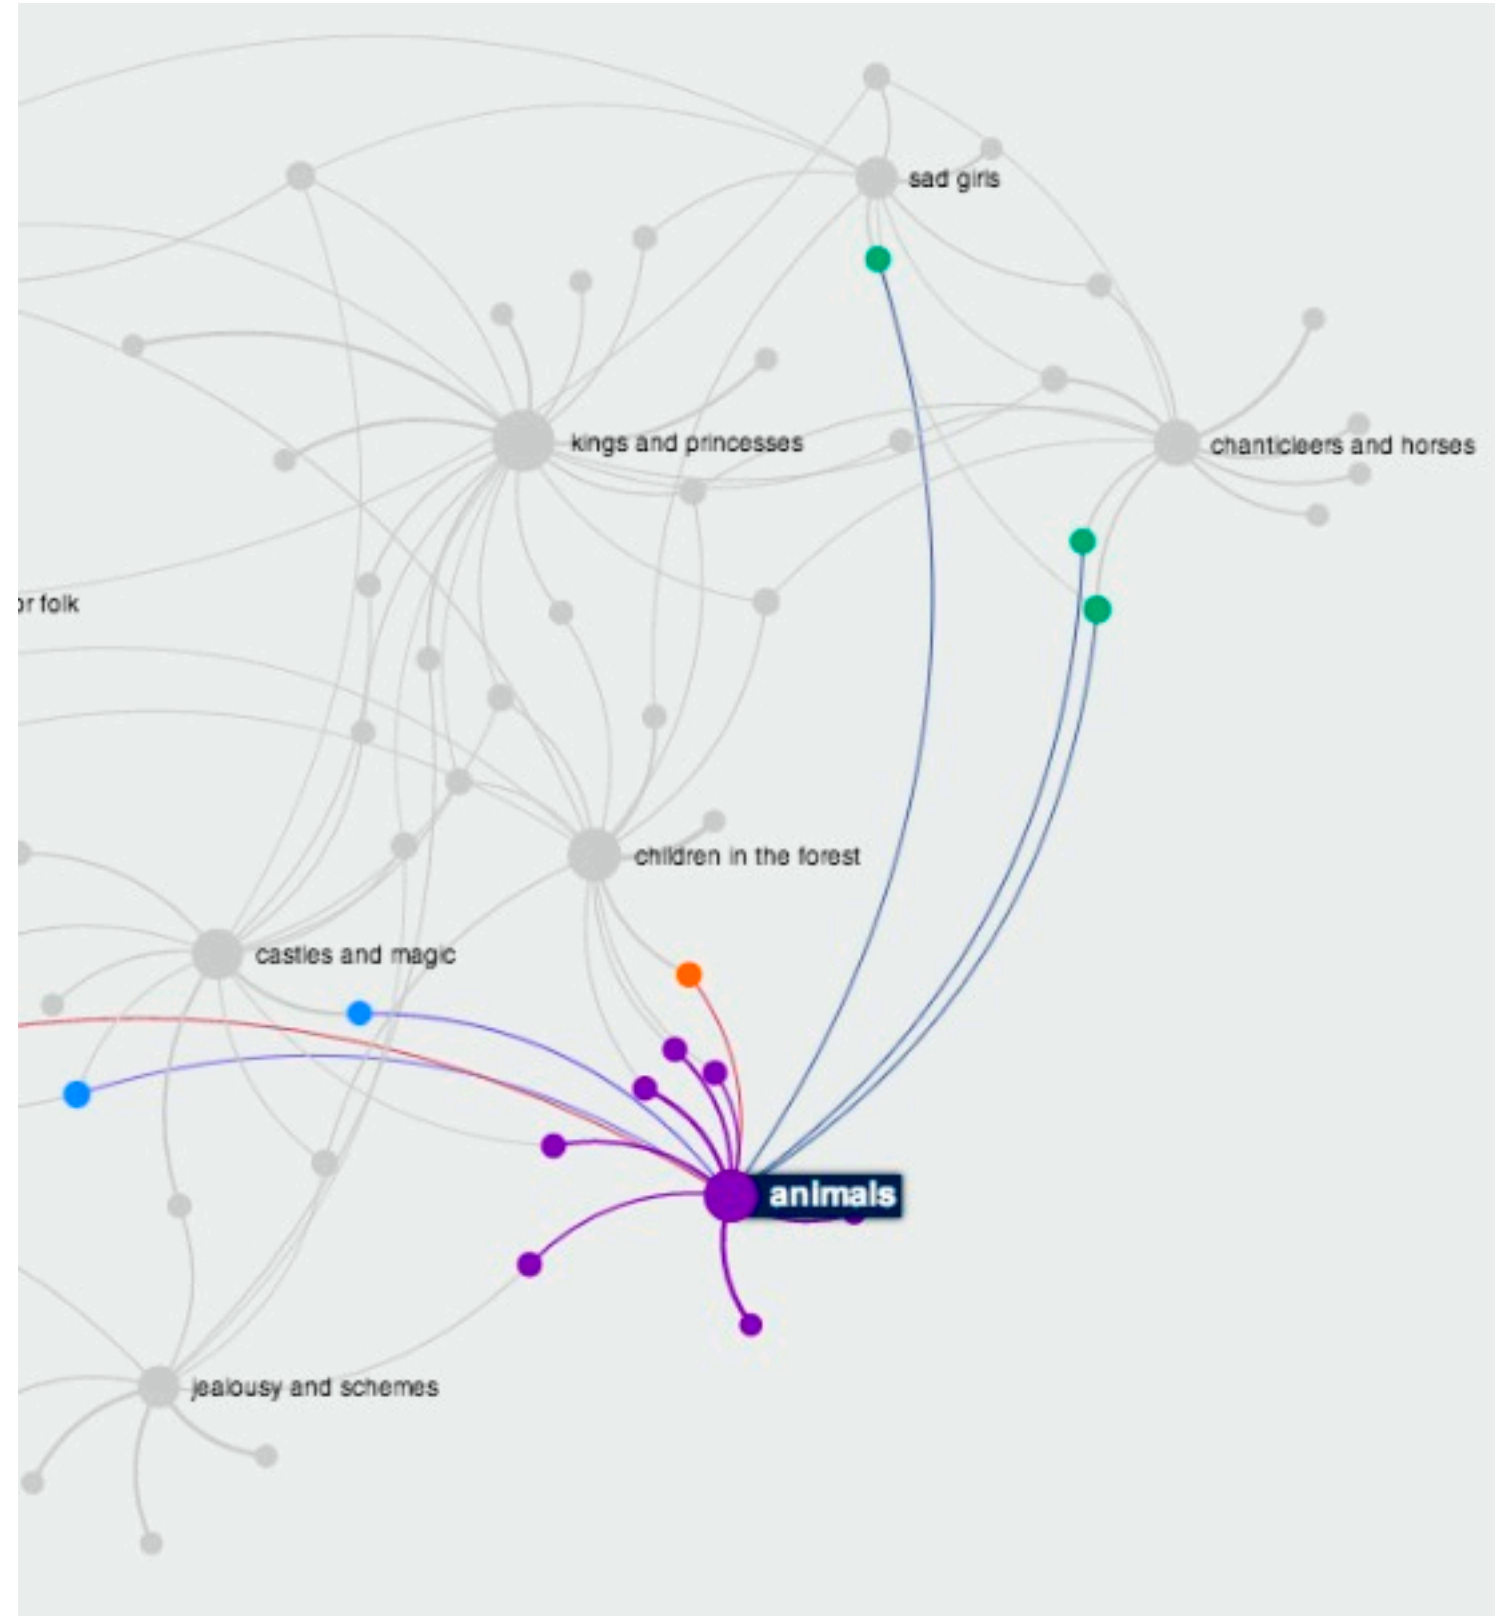

Copy the data.json file to **another name** and edit that, as you browse the network.

```
sons and last of all one daughter. Although the little girl was very
pretty she was so weak and small that they thought she could not live;
but they said she should at once be christened. So the father sent one
of his sons in haste to the spring to get some water but the other six
ran with him. ...\""",
  "title": "THE SEVEN RAVENS"
},
"color": "rgb(15,249,249)",
"size": 3.0
},
{
  "label": "bird mother",

```

relabel the topics with a more human interpretable name based on inspection

For example...
swapping in my
data_renamed.json
file...

But you may find
you want to redo
the topic modeling
with more or
fewer topic.

- The utility of this graph is improved by useful text/content additions in the graph file (the python exercise we went thru first) and some tweaks in the output visuals.
- It could be even better by post-processing the modularity groups to have better names than “group 2”...
- NOTE: The sigma.js exporter from Gephi is out of date, using an old sigma.js format. It also seems to not differentiate weights/sizes of edges very well. Caveats!

Hope this helped!

lynn@ghostweather.com
